#### Camera Obscura used for Tracing

Lens Based Camera Obscura, 1568

#### First Photograph

#### Oldest surviving photograph

Took 8 hours on pewter plate

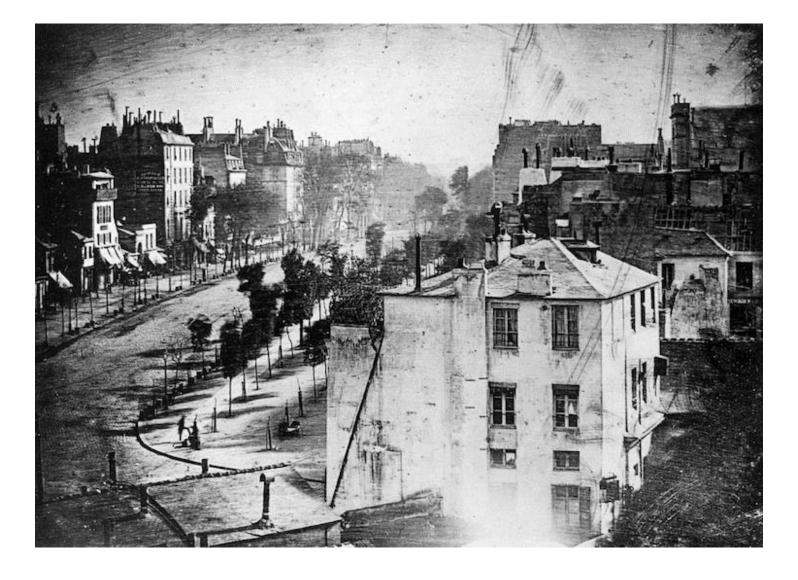

Joseph Niepce, 1826

#### Photograph of the first photograph

On display at UT Austin

Niepce later teamed up with Daguerre, who eventually created Daguerrotypes

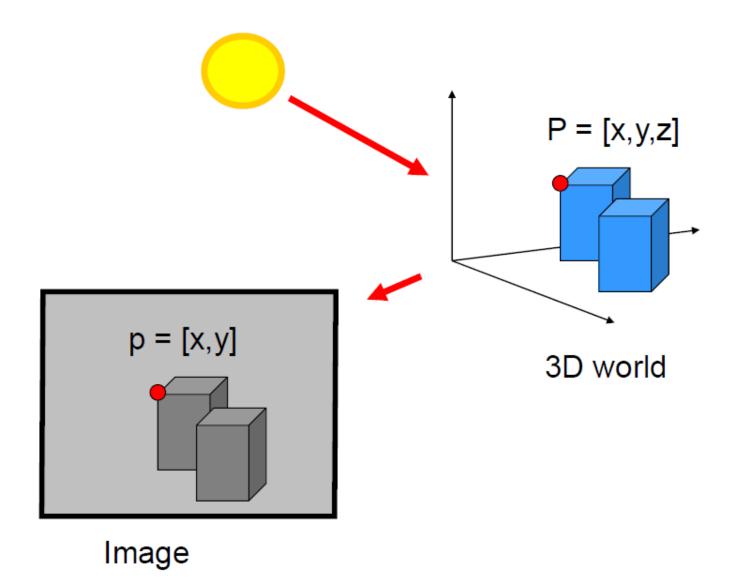

"Louis Daguerre—the inventor of daguerreotype—shot what is not only the world's oldest photograph of Paris, but also the first photo with humans. The 10-minute long exposure was taken in 1839 in Place de la République and it's just possible to make out two blurry figures in the left-hand corner."

Great history lesson on the chemistry and engineering challenges of early photography from the "Technology Connections" YouTube channel.

#### What is lost?

Length

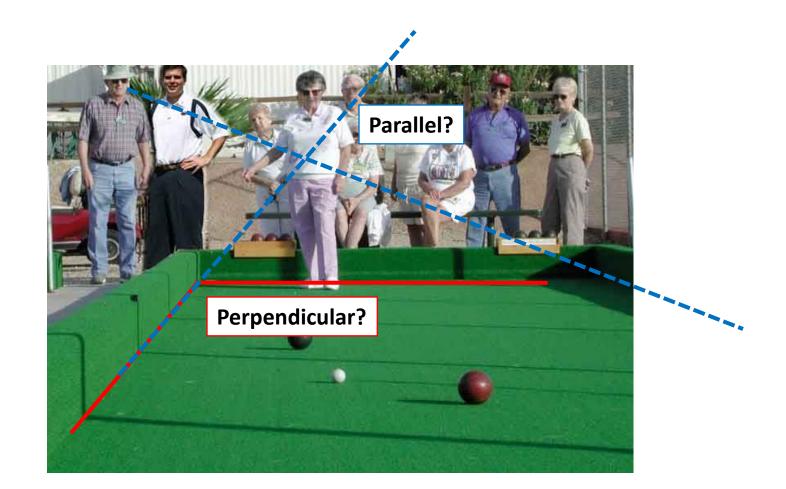

#### Length and area are not preserved

#### **Projective Geometry**

#### What is lost?

- Length
- Angles

#### **Projective Geometry**

#### What is preserved?

• Straight lines are still straight

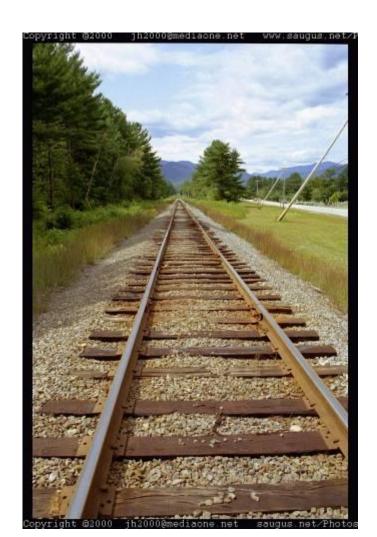

## The pinhole camera model preserves straight lines, but real cameras might not

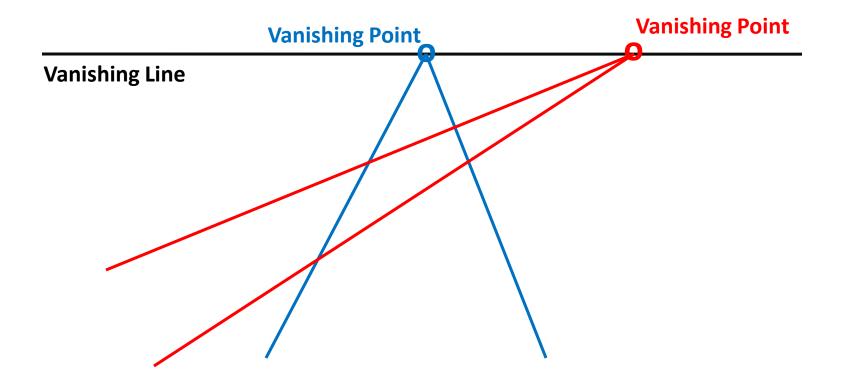

#### Vanishing points and lines

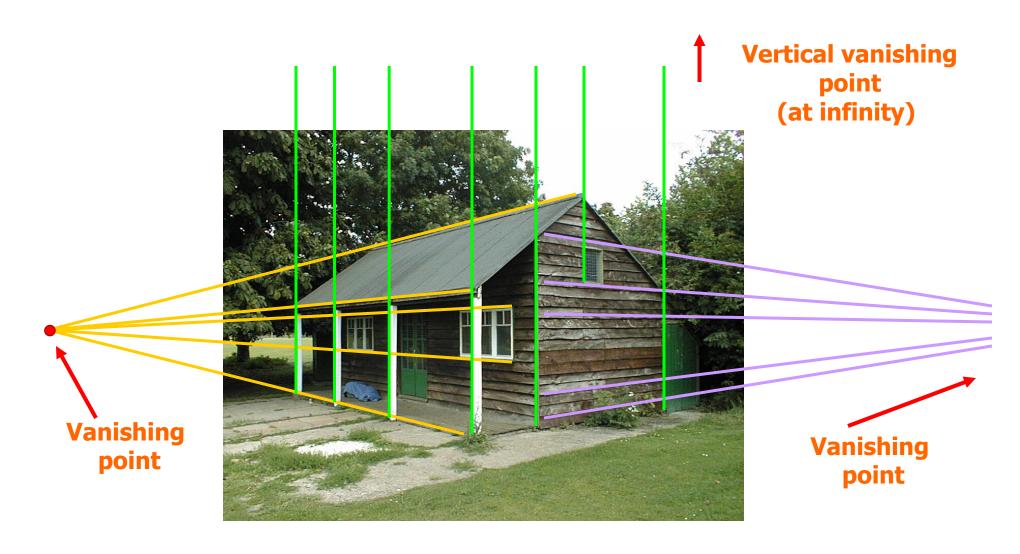

Parallel lines in the world intersect in the image at a "vanishing point"

#### Projection: world coordinates $\rightarrow$ image coordinates

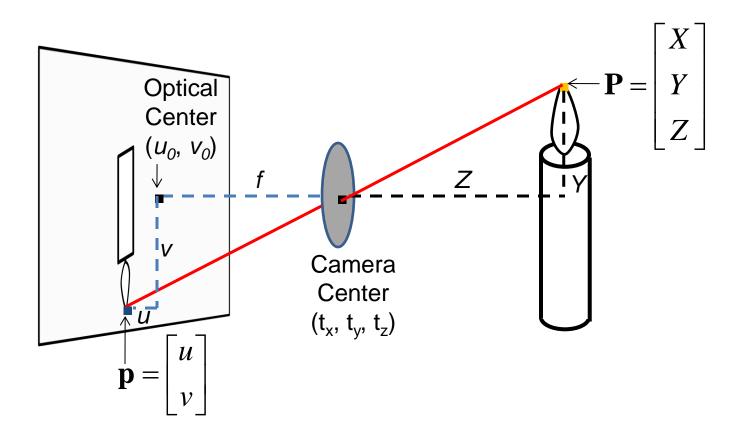

If 
$$x = 2$$
,  $y = 3$ ,  $z = 5$ , and  $f = 2$   
What are u' and v'?

$$u' = -x * \frac{f}{z} \qquad u' = -2 * \frac{2}{5}$$

$$\frac{v'}{-f} = \frac{y}{z} \qquad v' = -y * \frac{f}{z} \qquad v' = -3 * \frac{2}{5}$$

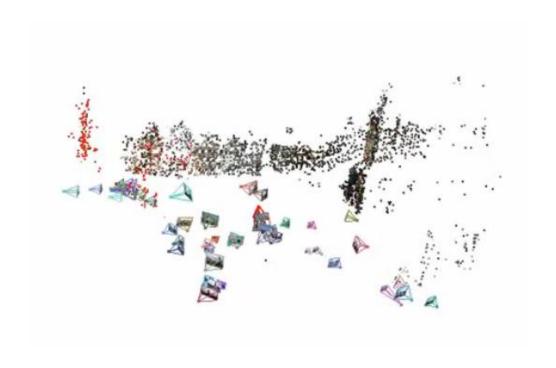

#### Projection: world coordinates image coordinates

How do we handle the general case?

How do we handle the general case?

#### Homogeneous coordinates

#### Conversion

#### Converting to *homogeneous* coordinates

$$(x,y) \Rightarrow \left[ egin{array}{c} x \\ y \\ 1 \end{array} \right]$$

homogeneous image coordinates

$$(x,y) \Rightarrow \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} \qquad (x,y,z) \Rightarrow \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

homogeneous scene coordinates

#### Converting *from* homogeneous coordinates

$$\begin{bmatrix} x \\ y \\ w \end{bmatrix} \Rightarrow (x/w, y/w) \qquad \begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix} \Rightarrow (x/w, y/w, z/w)$$

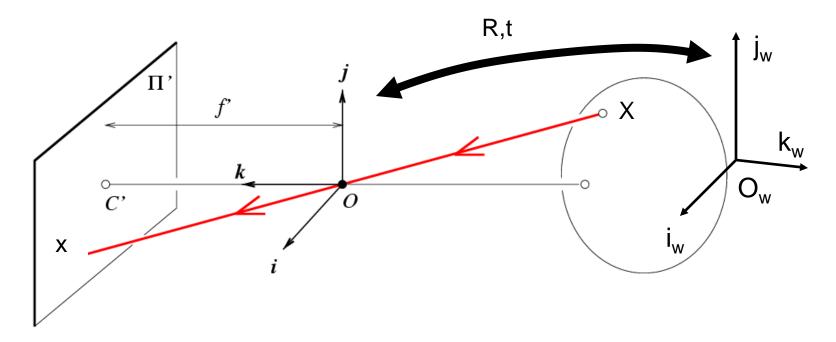

#### Homogeneous coordinates

#### Invariant to scaling

$$k \begin{bmatrix} x \\ y \\ w \end{bmatrix} = \begin{bmatrix} kx \\ ky \\ kw \end{bmatrix} \Rightarrow \begin{bmatrix} \frac{kx}{kw} \\ \frac{ky}{kw} \end{bmatrix} = \begin{bmatrix} \frac{x}{w} \\ \frac{y}{w} \end{bmatrix}$$

## **Hybrid Images**

 A. Oliva, A. Torralba, P.G. Schyns, <u>"Hybrid Images,"</u> SIGGRAPH 2006

## Upcoming classes: two views of filtering

- Image filters in spatial domain
  - Filter is a mathematical operation of a grid of numbers
  - Smoothing, sharpening, measuring texture

- Image filters in the frequency domain
  - Filtering is a way to modify the frequencies of images
  - Denoising, sampling, image compression

## Image filtering (or convolution)

 Image filtering: compute function of local neighborhood at each position

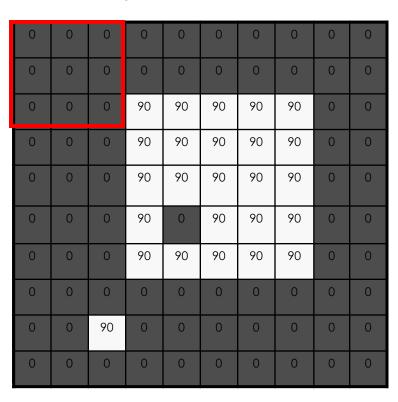

- Really important!
  - Enhance images
    - Denoise, resize, increase contrast, etc.
  - Extract information from images
    - Texture, edges, distinctive points, etc.
  - Deep Convolutional Networks

### Filtering vs. Convolution

2d filtering

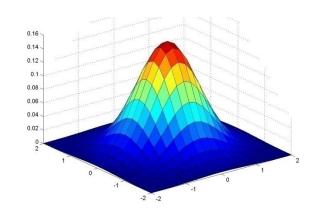

$$h[m,n] = \sum_{k,l} f[k,l] I[m+k,n+l]$$

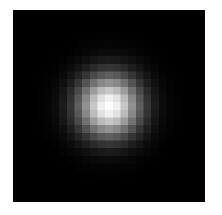

2d convolution

$$h[m,n] = \sum_{k,l} f[k,l] I[m-k,n-l]$$

,  $\sigma = 1$ 

$$G_{\sigma} = \frac{1}{2\pi\sigma^2} e^{-\frac{(x^2+y^2)}{2\sigma^2}}$$

# Smoothing with Gaussian filter

## Smoothing with box filter

#### Gaussian filters

- Remove "high-frequency" components from the image (low-pass filter)
  - Images become more smooth
- Convolution with self is another Gaussian
  - So can smooth with small-width kernel, repeat, and get same result as larger-width kernel would have
  - Convolving two times with Gaussian kernel of width  $\sigma$  is same as convolving once with kernel of width  $\sigma$ V2
- Separable kernel
  - Factors into product of two 1D Gaussians

## Separability of the Gaussian filter

$$G_{\sigma}(x,y) = \frac{1}{2\pi\sigma^{2}} \exp^{-\frac{x^{2}+y^{2}}{2\sigma^{2}}}$$

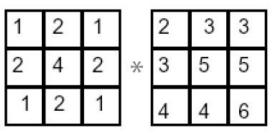

$$= \left(\frac{1}{\sqrt{2\pi}\sigma} \exp^{-\frac{x^{2}}{2\sigma^{2}}}\right) \left(\frac{1}{\sqrt{2\pi}\sigma} \exp^{-\frac{y^{2}}{2\sigma^{2}}}\right)$$

The 2D Gaussian can be expressed as the product of two functions, one a function of *x* and the other a function of *y* 

In this case, the two functions are the (identical) 1D Gaussian

## Separability example

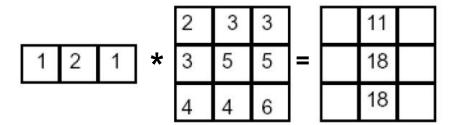

2D convolution (center location only)

The filter factors into a product of 1D filters:

1	2	1		1	Х	1	2	
2	4	2	=	2				
1	2	1		1				

Perform convolution along rows:

Followed by convolution along the remaining column:

# Separability

• Why is separability useful in practice?

# Some practical matters

#### Practical matters

#### How big should the filter be?

- Values at edges should be near zero
- Rule of thumb for Gaussian: set filter half-width to about 3  $\sigma$

#### Practical matters

- What about near the edge?
  - the filter window falls off the edge of the image
  - need to extrapolate
  - methods:
    - clip filter (black)
    - wrap around
    - copy edge
    - reflect across edge
