house, where the professor lived without his wife and child; or so he said jokingly sometimes: "Here's where I live. My house." His daughter often added, without resentment, for the visitor's information, "It started out to be for me, but it's really his." And she might reach in to bring forth an inch-high table lamp with fluted shade, or a blue dish the size of her little fingernail, marked "Kitty" and half full of eternal milk, but she was sure to replace these, after they had been admired, pretty near exactly where they had been. The little house was very orderly, and just big enough for all it contained, though to some tastes the bric-à-brac in the parlor might seem excessive. The daughter's preference was for the store-bought gimmicks and appliances, the toasters and carpet sweepers of Lilliput, but she knew that most adult visitors would

How Useful is Self-Supervised Pretraining for Visual Tasks?

Alejandro Newell Jia Deng

Princeton University

{anewell, jiadeng}@cs.princeton.edu

Figure 1. We highlight three possible outcomes when using self-supervised pretraining, the pretrained model either: a) always provides an improvement over the the model trained from scratch even as the amount of labeled data increases, b) reaches higher accuracy with fewer labels but plateaus to the same accuracy as the baseline, c) converges to baseline performance before accuracy plateaus. In our experiments we find option (c) to be the most common outcome.
