

Erik Johansson

From last lecture

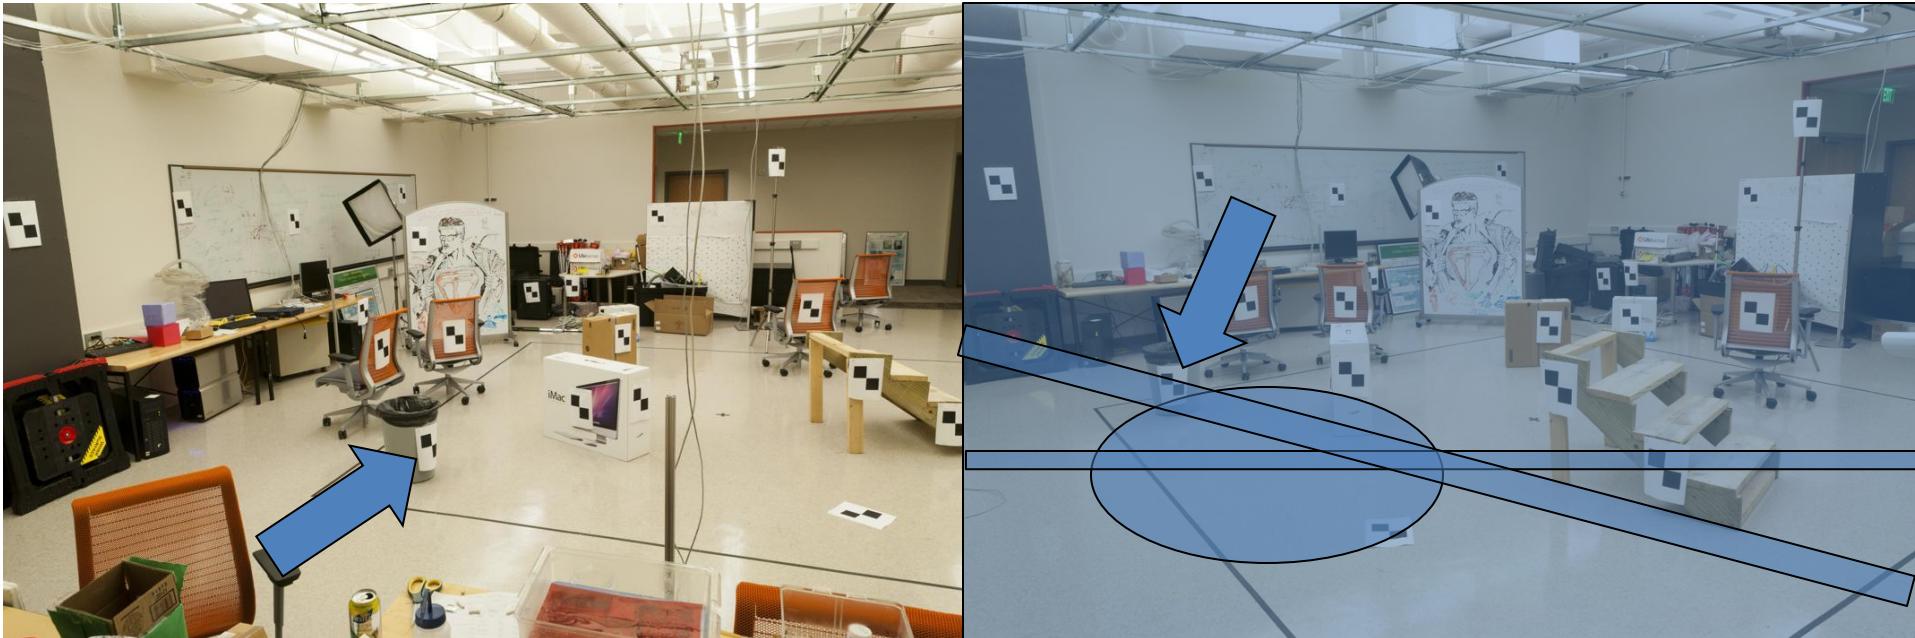

- Stereo and lidar can fall victim to mirrors?
- Yes, there's no easy way around that
- <https://youtu.be/pBzU8TD1iks>

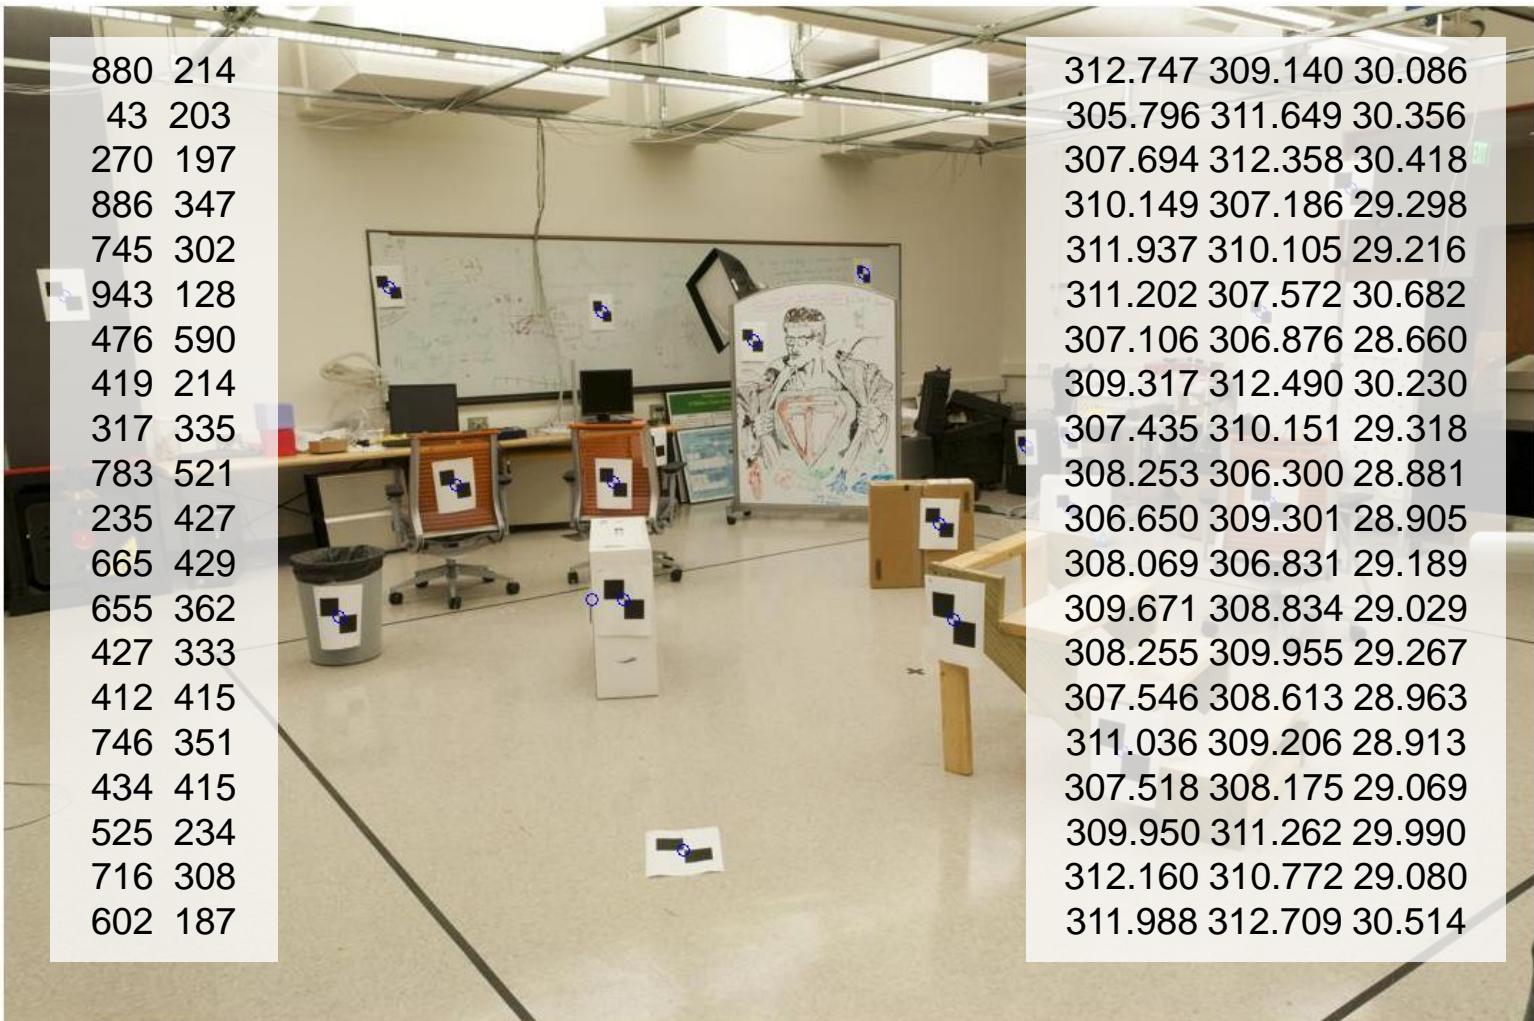

Outline

- Camera calibration
- Epipolar Geometry

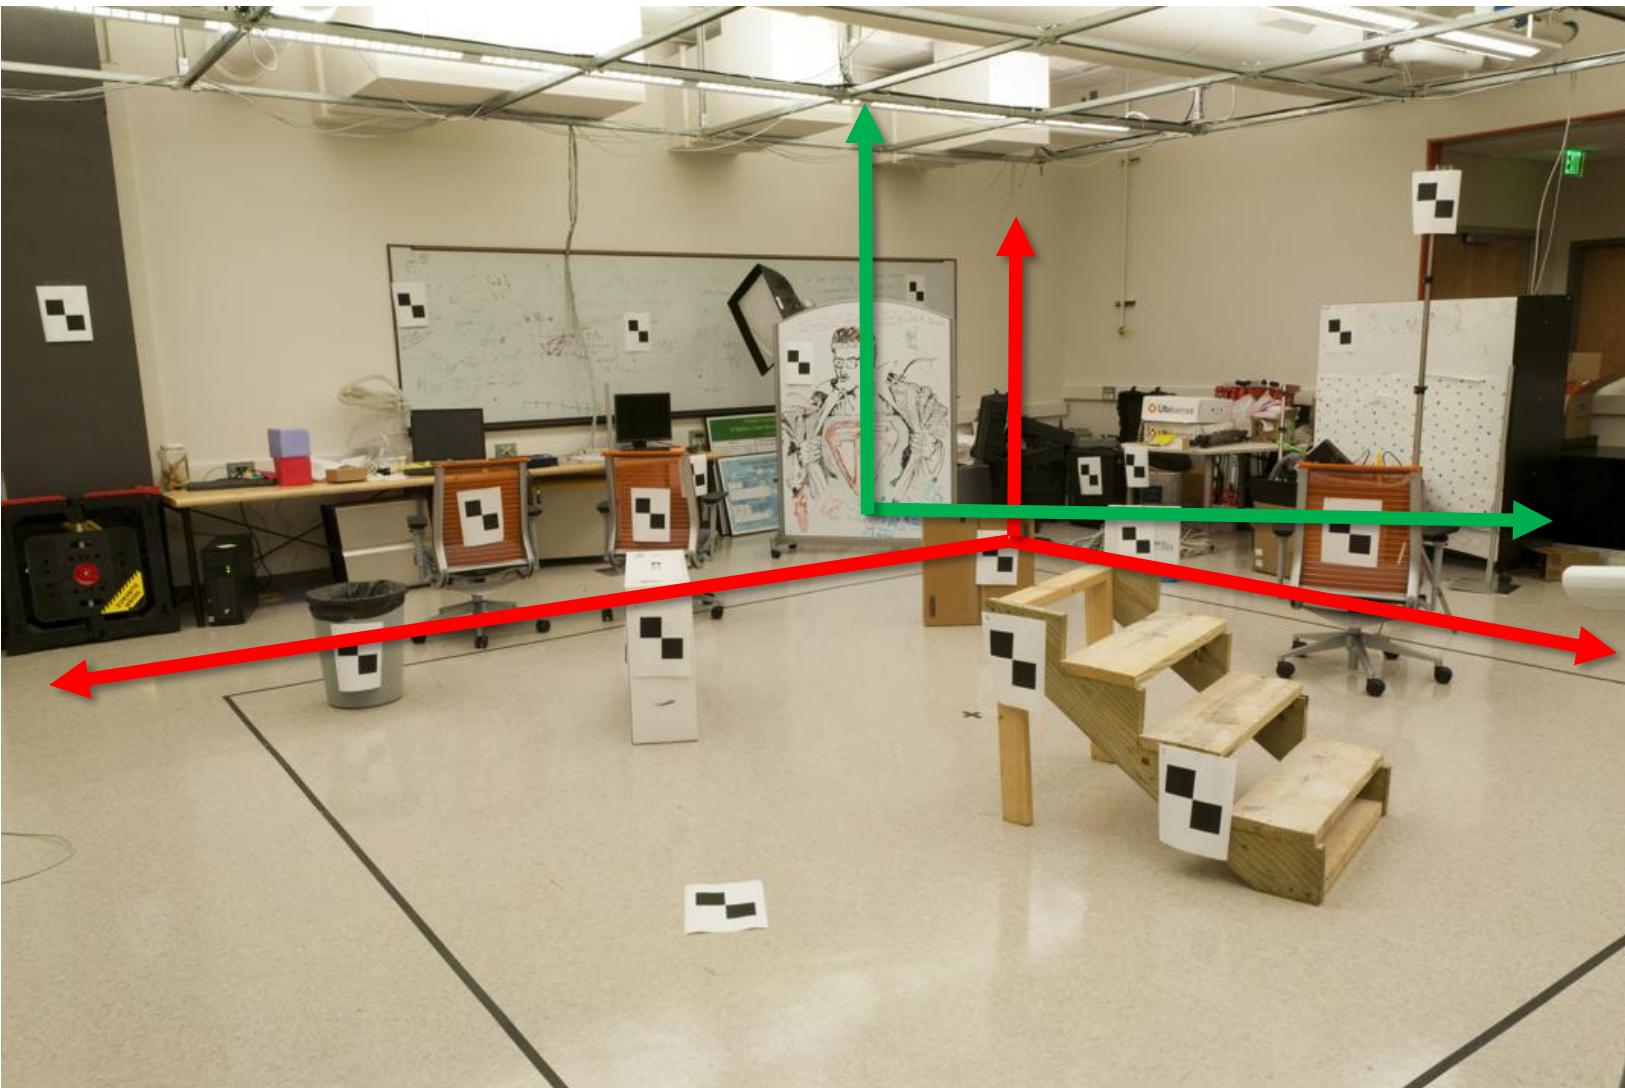

Where do we need to search?

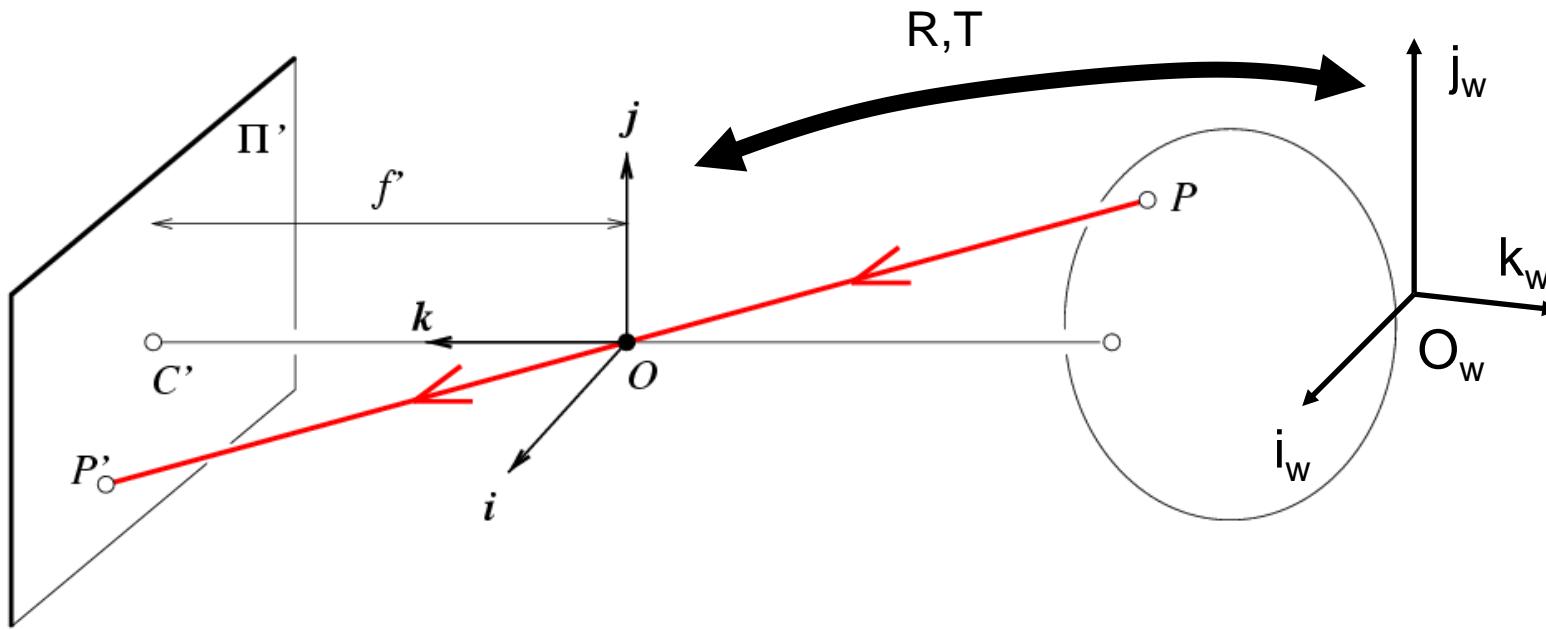

How do we calibrate a camera?

World vs Camera coordinates

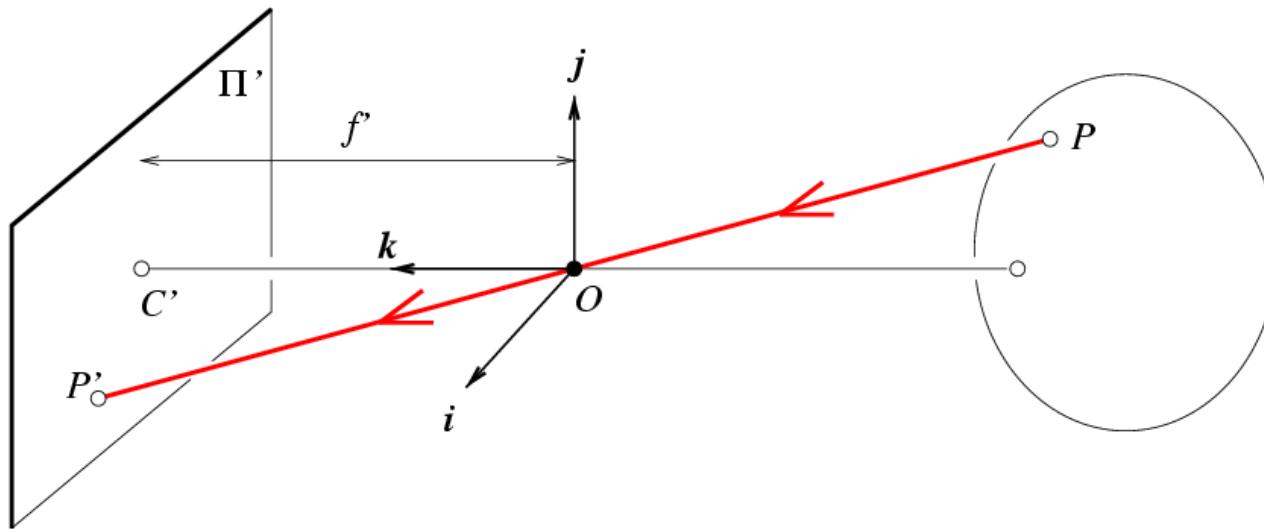

Projection matrix

$$\mathbf{x} = \mathbf{K}[\mathbf{R} \quad \mathbf{t}] \mathbf{X}$$

\mathbf{x} : Image Coordinates: $(u, v, 1)$
 \mathbf{K} : Intrinsic Matrix (3x3)
 \mathbf{R} : Rotation (3x3)
 \mathbf{t} : Translation (3x1)
 \mathbf{X} : World Coordinates: $(X, Y, Z, 1)$

Projection matrix

Intrinsic Assumptions

- Unit aspect ratio
- Optical center at (0,0)
- No skew

Extrinsic Assumptions

- No rotation
- Camera at (0,0,0)

$$\mathbf{x} = \mathbf{K} [\mathbf{I} \quad \mathbf{0}] \mathbf{X} \rightarrow w \begin{bmatrix} u \\ v \\ 1 \end{bmatrix} = \begin{bmatrix} f & 0 & 0 & 0 \\ 0 & f & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

Remove assumption: known optical center

Intrinsic Assumptions

- Unit aspect ratio
- No skew

Extrinsic Assumptions

- No rotation
- Camera at (0,0,0)

$$\mathbf{x} = \mathbf{K} \begin{bmatrix} \mathbf{I} & \mathbf{0} \end{bmatrix} \mathbf{X} \quad \xrightarrow{\text{blue arrow}} \quad w \begin{bmatrix} u \\ v \\ 1 \end{bmatrix} = \begin{bmatrix} f & 0 & u_0 \\ 0 & f & v_0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

Remove assumption: square pixels

Intrinsic Assumptions

- No skew

Extrinsic Assumptions

- No rotation
- Camera at (0,0,0)

$$\mathbf{x} = \mathbf{K} \begin{bmatrix} \mathbf{I} & \mathbf{0} \end{bmatrix} \mathbf{X} \rightarrow w \begin{bmatrix} u \\ v \\ 1 \end{bmatrix} = \begin{bmatrix} \alpha & 0 & u_0 \\ 0 & \beta & v_0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

Remove assumption: non-skewed pixels

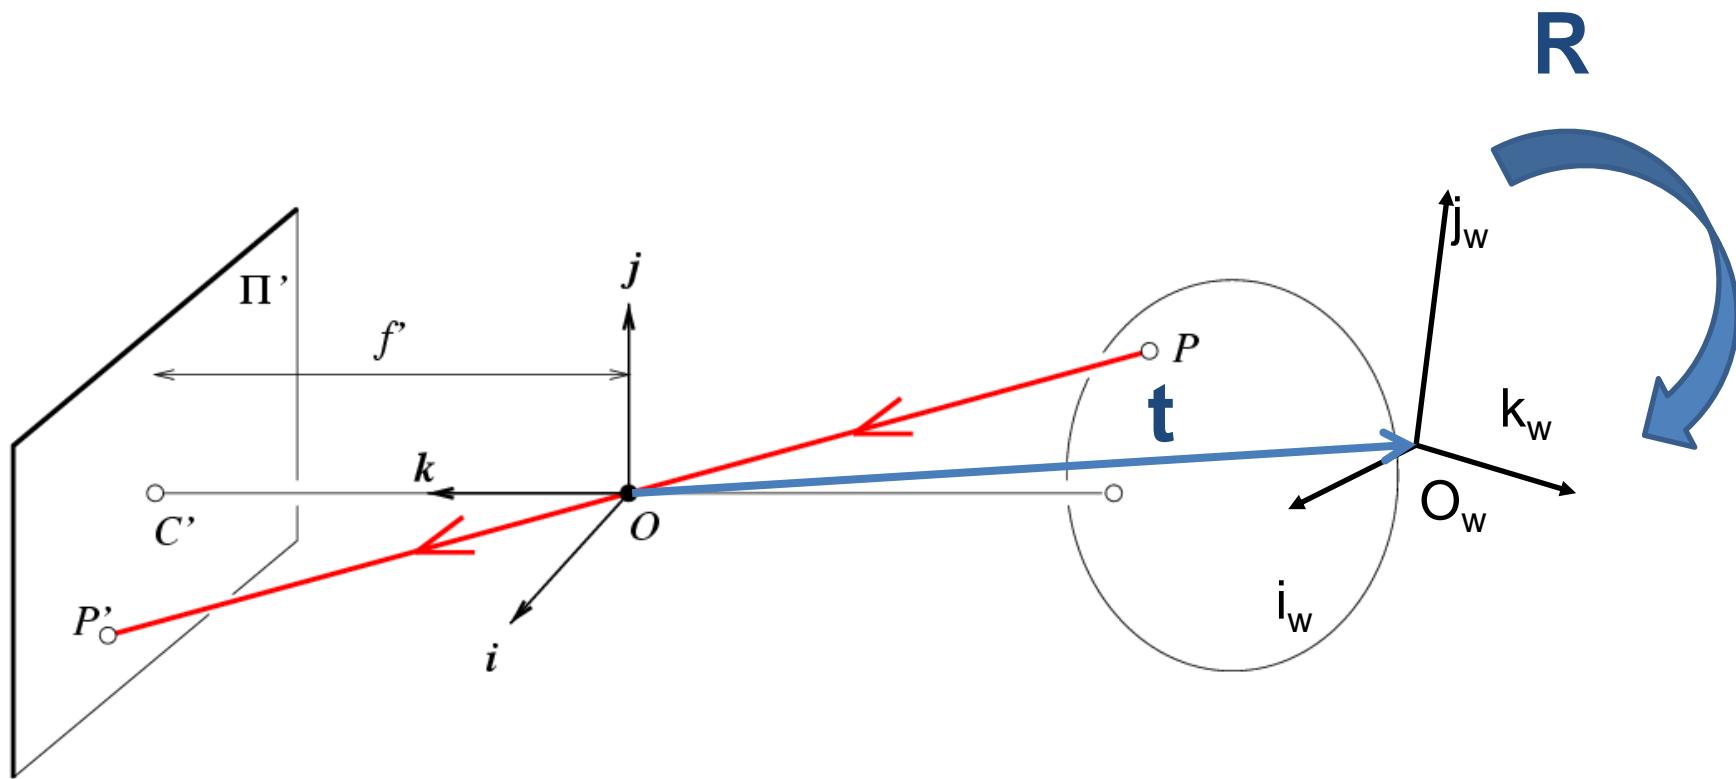

Intrinsic Assumptions Extrinsic Assumptions

- No rotation
- Camera at (0,0,0)

$$\mathbf{x} = \mathbf{K} \begin{bmatrix} \mathbf{I} & \mathbf{0} \end{bmatrix} \mathbf{X} \xrightarrow{\text{blue arrow}} w \begin{bmatrix} u \\ v \\ 1 \end{bmatrix} = \begin{bmatrix} \alpha & s & u_0 \\ 0 & \beta & v_0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

Note: different books use different notation for parameters

Oriented and Translated Camera

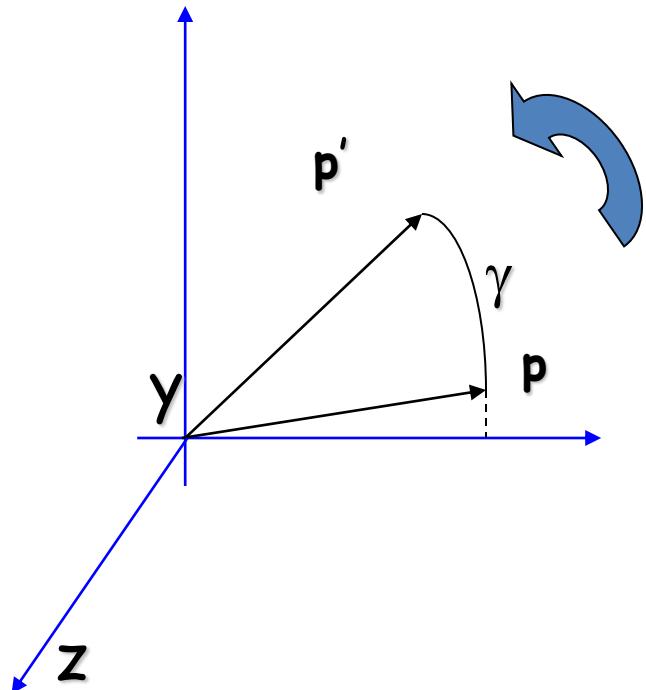

Allow camera translation

Intrinsic Assumptions Extrinsic Assumptions
• No rotation

$$\mathbf{x} = \mathbf{K}[\mathbf{I} \quad \mathbf{t}] \mathbf{X} \quad \xrightarrow{\text{blue arrow}} \quad w \begin{bmatrix} u \\ v \\ 1 \end{bmatrix} = \begin{bmatrix} \alpha & s & u_0 \\ 0 & \beta & v_0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & t_x \\ 0 & 1 & 0 & t_y \\ 0 & 0 & 1 & t_z \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

3D Rotation of Points

Rotation around the coordinate axes, **counter-clockwise**:

$$R_x(\alpha) = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos \alpha & -\sin \alpha \\ 0 & \sin \alpha & \cos \alpha \end{bmatrix}$$

$$R_y(\beta) = \begin{bmatrix} \cos \beta & 0 & \sin \beta \\ 0 & 1 & 0 \\ -\sin \beta & 0 & \cos \beta \end{bmatrix}$$

$$R_z(\gamma) = \begin{bmatrix} \cos \gamma & -\sin \gamma & 0 \\ \sin \gamma & \cos \gamma & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Allow camera rotation

$$\mathbf{x} = \mathbf{K} [\mathbf{R} \quad \mathbf{t}] \mathbf{X}$$

$$w \begin{bmatrix} u \\ v \\ 1 \end{bmatrix} = \begin{bmatrix} \alpha & s & u_0 \\ 0 & \beta & v_0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} r_{11} & r_{12} & r_{13} & t_x \\ r_{21} & r_{22} & r_{23} & t_y \\ r_{31} & r_{32} & r_{33} & t_z \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

Degrees of freedom

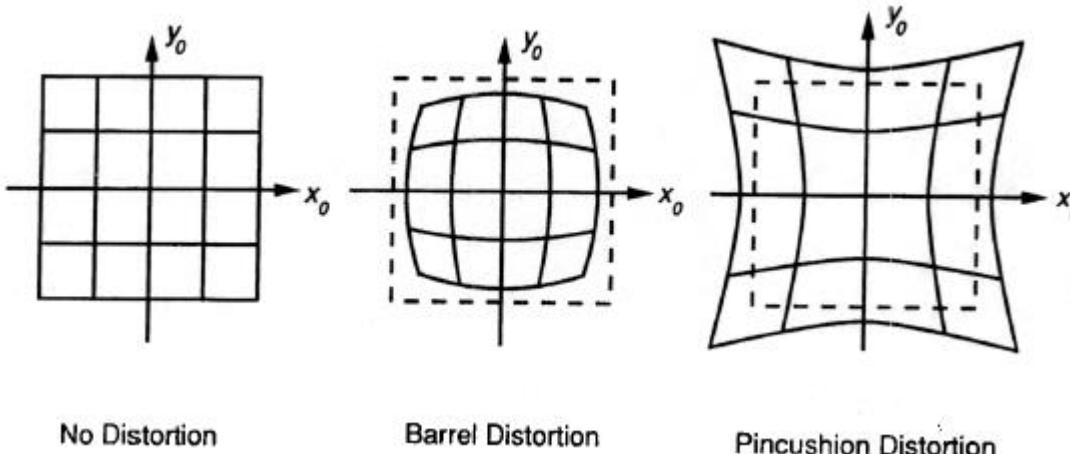

$$\mathbf{x} = \mathbf{K}[\mathbf{R} \quad \mathbf{t}] \mathbf{X}$$

$$w \begin{bmatrix} u \\ v \\ 1 \end{bmatrix} = \begin{bmatrix} \alpha & s & u_0 \\ 0 & \beta & v_0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} r_{11} & r_{12} & r_{13} & t_x \\ r_{21} & r_{22} & r_{23} & t_y \\ r_{31} & r_{32} & r_{33} & t_z \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

Beyond Pinholes: Radial Distortion

- Common in wide-angle lenses or for special applications (e.g., security)
- Creates non-linear terms in projection
- Usually handled by through solving for non-linear terms and then correcting image

How to calibrate the camera? (also called “camera resectioning”)

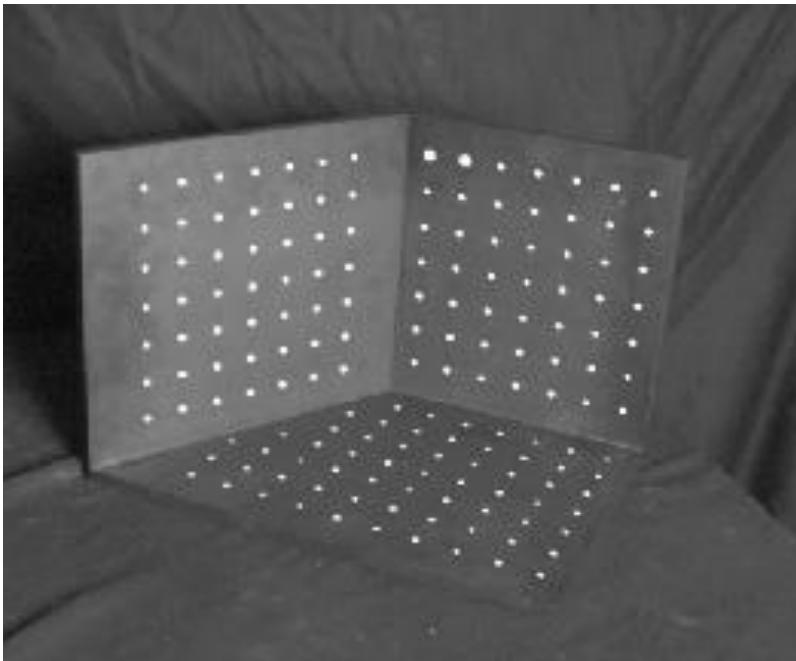

$$\mathbf{x} = \mathbf{K}[\mathbf{R} \quad \mathbf{t}] \mathbf{X}$$

$$\begin{bmatrix} su \\ sv \\ s \end{bmatrix} = \begin{bmatrix} * & * & * & * \\ * & * & * & * \\ * & * & * & * \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$

Calibrating the Camera

Use a scene with known geometry

- Correspond image points to 3d points
- Get least squares solution (or non-linear solution)

Known 2d
image coords

$$\begin{bmatrix} su \\ sv \\ s \end{bmatrix} = \begin{bmatrix} m_{11} & m_{12} & m_{13} \\ m_{21} & m_{22} & m_{23} \\ m_{31} & m_{32} & m_{33} \end{bmatrix}$$

Known 3d
locations

$$\begin{bmatrix} m_{14} \\ m_{24} \\ m_{34} \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$

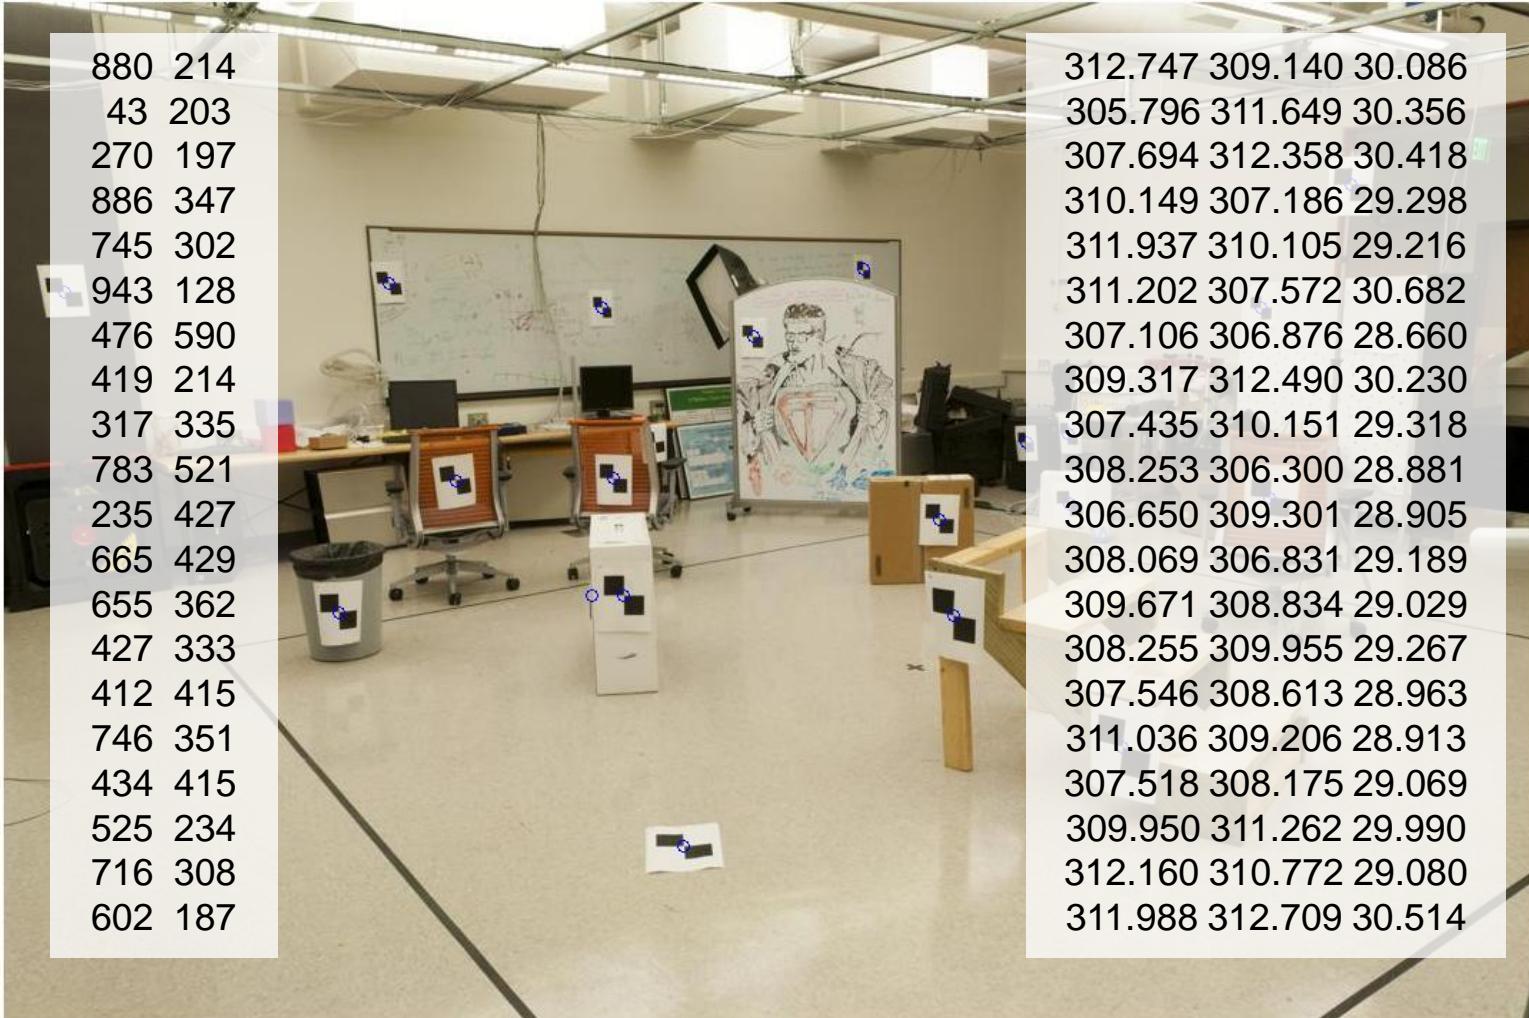

Unknown Camera Parameters

- Method 2 – nonhomogeneous linear system. Solve for m's entries using linear least squares

Ax=b form

$$\begin{bmatrix} X_1 & Y_1 & Z_1 & 1 & 0 & 0 & 0 & -u_1X_1 & -u_1Y_1 & -u_1Z_1 \\ 0 & 0 & 0 & 0 & X_1 & Y_1 & Z_1 & 1 & -v_1X_1 & -v_1Y_1 & -v_1Z_1 \\ & & & & \vdots & & & & & & \\ X_n & Y_n & Z_n & 1 & 0 & 0 & 0 & -u_nX_n & -u_nY_n & -u_nZ_n \\ 0 & 0 & 0 & 0 & X_n & Y_n & Z_n & 1 & -v_nX_n & -v_nY_n & -v_nZ_n \end{bmatrix} = \begin{bmatrix} m_{11} \\ m_{12} \\ m_{13} \\ m_{14} \\ m_{21} \\ m_{22} \\ m_{23} \\ m_{24} \\ m_{31} \\ m_{32} \\ m_{33} \end{bmatrix} = \begin{bmatrix} u_1 \\ v_1 \\ \vdots \\ u_n \\ v_n \end{bmatrix}$$

M = A\Y;
M = [M; 1];
M = reshape(M, [], 3)';

For python, see
numpy.linalg.lstsq

Calibration with linear method

- Advantages
 - Easy to formulate and solve
 - Provides initialization for non-linear methods
- Disadvantages
 - Doesn't directly give you camera parameters
 - Doesn't model radial distortion
 - Can't impose constraints, such as known focal length
- Non-linear methods are preferred
 - Define error as difference between projected points and measured points
 - Minimize error using Newton's method or other non-linear optimization

Can we factorize M back to K [R | T]?

- Yes!
- You can use *RQ* factorization (note – not the more familiar *QR* factorization). *R* (right diagonal) is K, and *Q* (orthogonal basis) is R. T, the last column of [R | T], is $\text{inv}(K) * \text{last column of } M$.
 - But you need to do a bit of post-processing to make sure that the matrices are valid. See
<http://ksimek.github.io/2012/08/14/decompose/>

Can we factorize M back to K [R | T]?

- Yes!
- Alternatively, you can more directly solve for the individual entries of K [R | T].

Extracting camera parameters

$$\frac{M}{\rho} = \begin{pmatrix} \alpha \mathbf{r}_1^T - \alpha \cot \theta \mathbf{r}_2^T + u_0 \mathbf{r}_3^T & \alpha t_x - \alpha \cot \theta t_y + u_0 t_z \\ \frac{\beta}{\sin \theta} \mathbf{r}_2^T + v_0 \mathbf{r}_3^T & \frac{\beta}{\sin \theta} t_y + v_0 t_z \\ \mathbf{r}_3^T & t_z \end{pmatrix} = \mathbf{K} [\mathbf{R} \quad \mathbf{T}]$$
$$\mathbf{K} = \begin{bmatrix} \alpha & -\alpha \cot \theta & u_o \\ 0 & \frac{\beta}{\sin \theta} & v_o \\ 0 & 0 & 1 \end{bmatrix}$$

Box 1

$$\mathbf{A} = \begin{bmatrix} \mathbf{a}_1^T \\ \mathbf{a}_2^T \\ \mathbf{a}_3^T \end{bmatrix} \quad \mathbf{b} = \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix}$$

Estimated values

Intrinsic

$$\rho = \frac{\pm 1}{|\mathbf{a}_3|} \quad u_o = \rho^2 (\mathbf{a}_1 \cdot \mathbf{a}_3) \\ v_o = \rho^2 (\mathbf{a}_2 \cdot \mathbf{a}_3)$$
$$\cos \theta = \frac{(\mathbf{a}_1 \times \mathbf{a}_3) \cdot (\mathbf{a}_2 \times \mathbf{a}_3)}{|\mathbf{a}_1 \times \mathbf{a}_3| \cdot |\mathbf{a}_2 \times \mathbf{a}_3|}$$

Extracting camera parameters

$$\frac{\mathcal{M}}{\rho} = \begin{pmatrix} \alpha \mathbf{r}_1^T - \alpha \cot \theta \mathbf{r}_2^T + u_0 \mathbf{r}_3^T & \alpha t_x - \alpha \cot \theta t_y + u_0 t_z \\ \frac{\beta}{\sin \theta} \mathbf{r}_2^T + v_0 \mathbf{r}_3^T & \frac{\beta}{\sin \theta} t_y + v_0 t_z \\ \mathbf{r}_3^T & t_z \end{pmatrix} = \mathbf{K} [\mathbf{R} \quad \mathbf{T}]$$

A **b**

$$A = \begin{bmatrix} \mathbf{a}_1^T \\ \mathbf{a}_2^T \\ \mathbf{a}_3^T \end{bmatrix} \quad b = \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix}$$

Estimated values

Intrinsic

$$\alpha = \rho^2 |\mathbf{a}_1 \times \mathbf{a}_3| \sin \theta$$

$$\beta = \rho^2 |\mathbf{a}_2 \times \mathbf{a}_3| \sin \theta$$

Extracting camera parameters

$$\frac{\mathcal{M}}{\rho} = \begin{pmatrix} \alpha \mathbf{r}_1^T - \alpha \cot \theta \mathbf{r}_2^T + u_0 \mathbf{r}_3^T & \alpha t_x - \alpha \cot \theta t_y + u_0 t_z \\ \frac{\beta}{\sin \theta} \mathbf{r}_2^T + v_0 \mathbf{r}_3^T & \frac{\beta}{\sin \theta} t_y + v_0 t_z \\ \mathbf{r}_3^T & t_z \end{pmatrix} = \mathbf{K} [\mathbf{R} \quad \mathbf{T}]$$

A **b**

$$A = \begin{bmatrix} \mathbf{a}_1^T \\ \mathbf{a}_2^T \\ \mathbf{a}_3^T \end{bmatrix} \quad b = \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix}$$

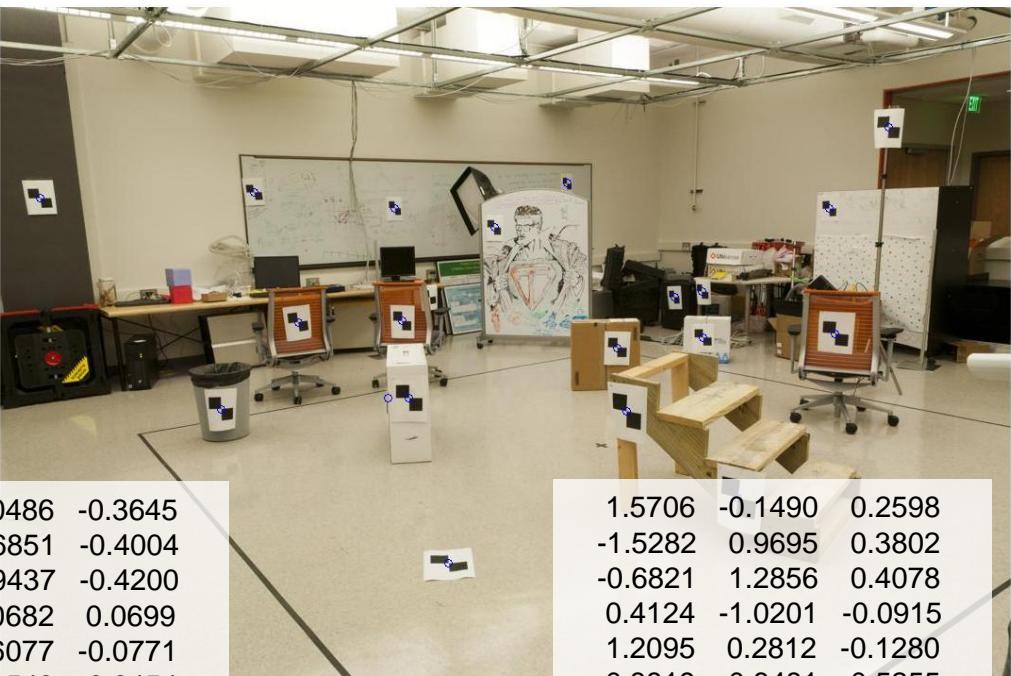

Estimated values

Extrinsic

$$\mathbf{r}_1 = \frac{(\mathbf{a}_2 \times \mathbf{a}_3)}{|\mathbf{a}_2 \times \mathbf{a}_3|} \quad \mathbf{r}_3 = \frac{\pm \mathbf{a}_3}{|\mathbf{a}_3|}$$
$$\mathbf{r}_2 = \mathbf{r}_3 \times \mathbf{r}_1 \quad \mathbf{T} = \rho \mathbf{K}^{-1} \mathbf{b}$$

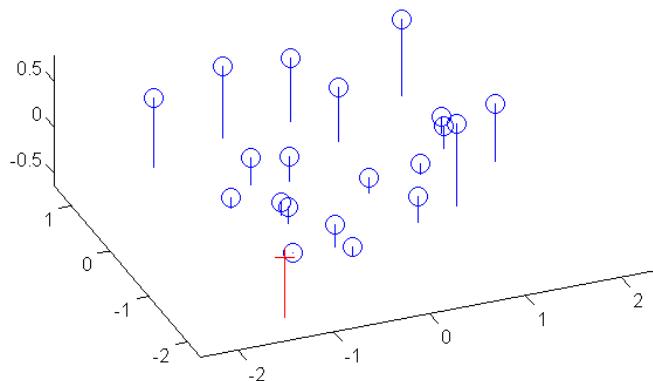

For project 3, we want the camera center

1.2323	1.4421	0.4506

Oriented and Translated Camera

Recovering the camera center

$$\mathbf{x} = \mathbf{K}[\mathbf{R} \quad \mathbf{t}] \mathbf{X}$$

$$w \begin{bmatrix} u \\ v \\ 1 \end{bmatrix} = \begin{bmatrix} \alpha & s & u_0 \\ 0 & \beta & v_0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} r_{11} & r_{12} & r_{13} \\ r_{21} & r_{22} & r_{23} \\ r_{31} & r_{32} & r_{33} \end{bmatrix} \begin{bmatrix} t_x \\ t_y \\ t_z \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

This is not the camera center $-\mathbf{C}$. It is $-\mathbf{RC}$ (because a point will be rotated before t_x , t_y , and t_z are added)

This, \mathbf{m}_4 , is $\mathbf{K} * \mathbf{t}$

So $\mathbf{K}^{-1} \mathbf{m}_4$ is \mathbf{t}

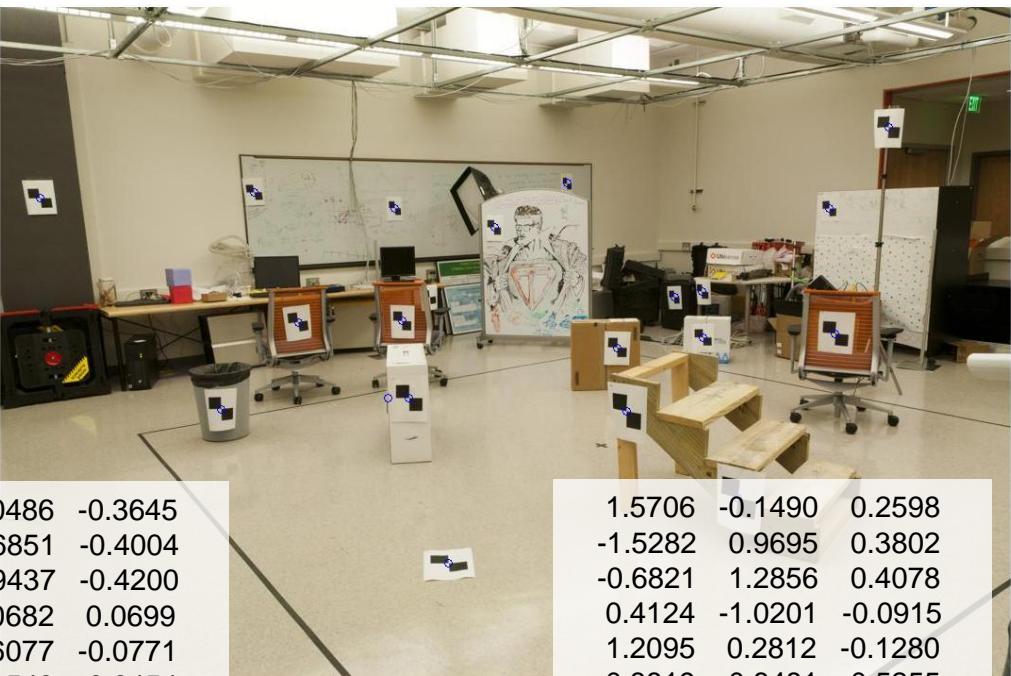

So we need
 $-\mathbf{R}^{-1} \mathbf{K}^{-1} \mathbf{m}_4$ to get \mathbf{C}

\mathbf{Q} is $\mathbf{K} * \mathbf{R}$. So we just
need $-\mathbf{Q}^{-1} \mathbf{m}_4$

$$\begin{bmatrix} su \\ sv \\ s \end{bmatrix} = \begin{bmatrix} * & * & * & * \\ * & * & * & * \\ * & * & * & * \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$

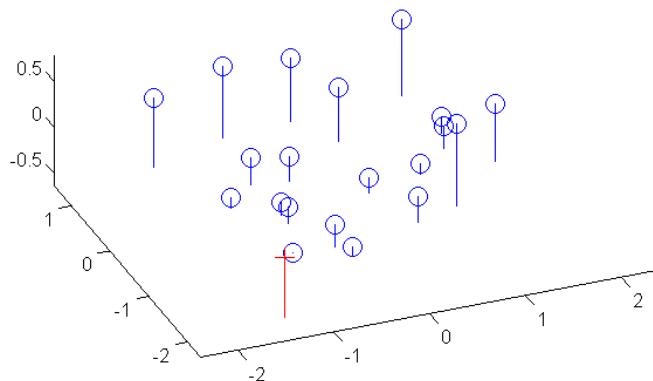

\mathbf{Q}

Epipolar Geometry and Stereo Vision

Chapter 11.2 in Szeliski

- Epipolar geometry
 - Relates cameras from two positions

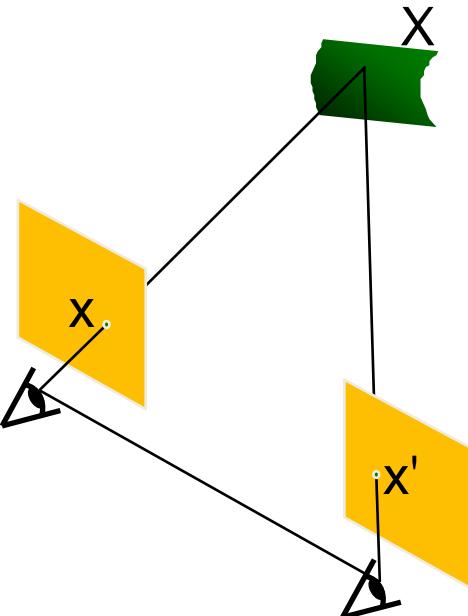

Depth from Stereo

- Goal: recover depth by finding image coordinate x' that corresponds to x

Depth from Stereo

- Goal: recover depth by finding image coordinate x' that corresponds to x
- Sub-Problems
 1. Calibration: How do we recover the relation of the cameras (if not already known)?
 2. Correspondence: How do we search for the matching point x' ?

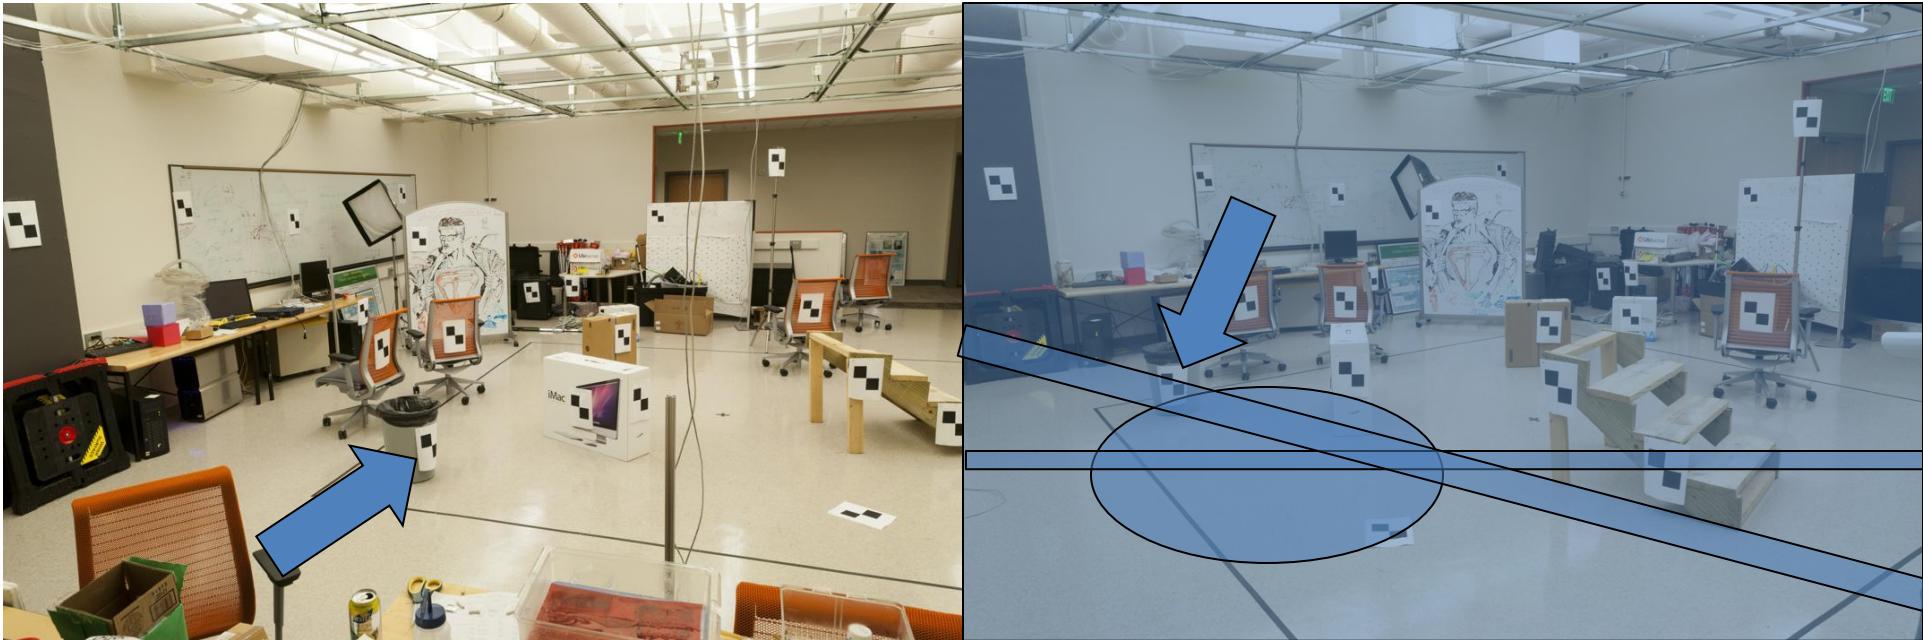

Correspondence Problem

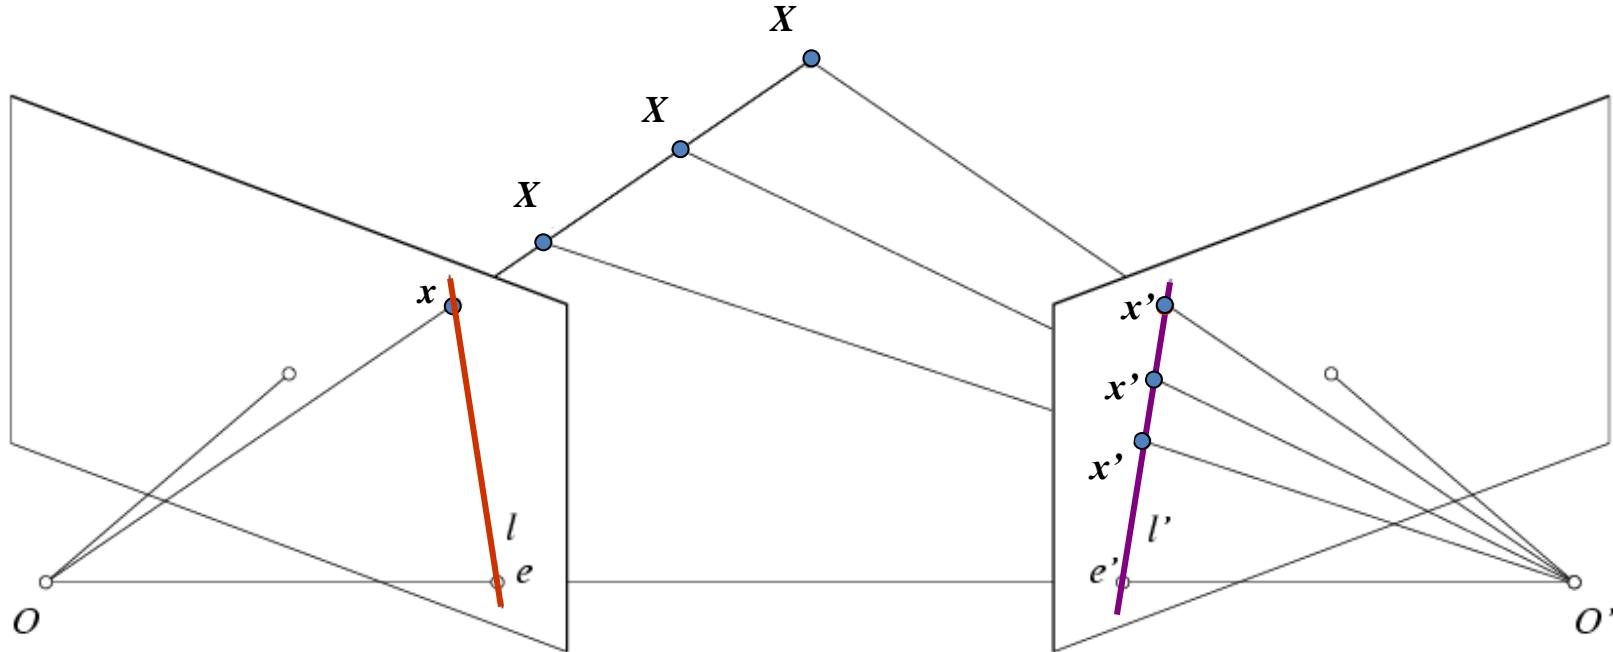

- We have two images taken from cameras with different intrinsic and extrinsic parameters
- How do we match a point in the first image to a point in the second? How can we constrain our search?

Where do we need to search?

Key idea: Epipolar constraint

Key idea: Epipolar constraint

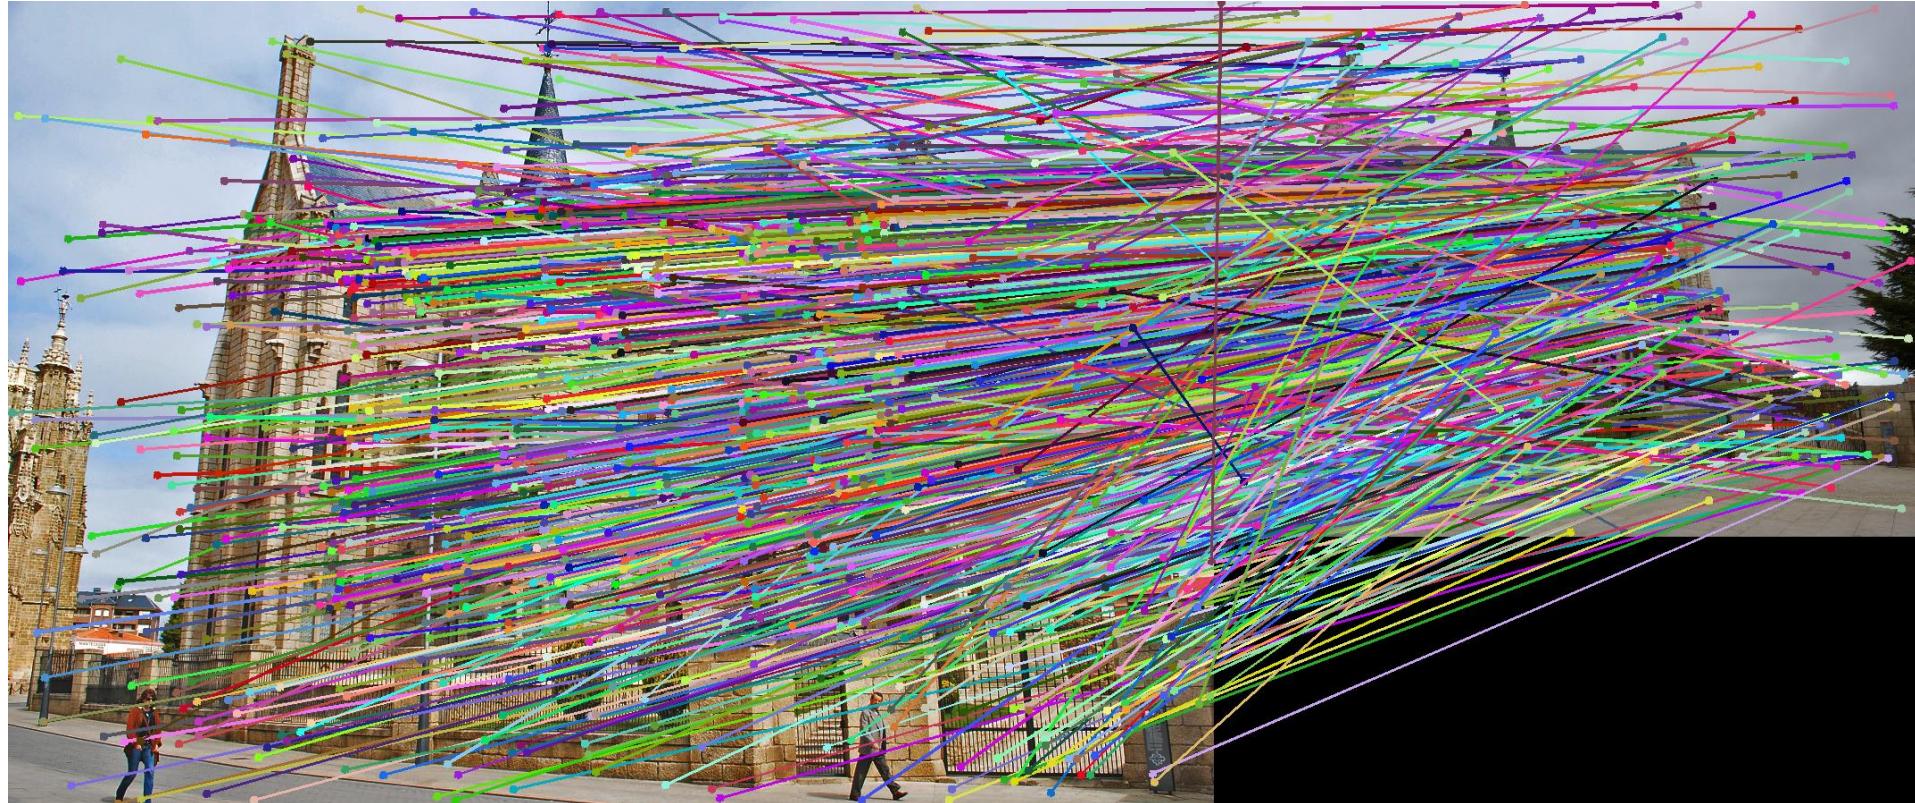

Potential matches for x have to lie on the corresponding line l' .

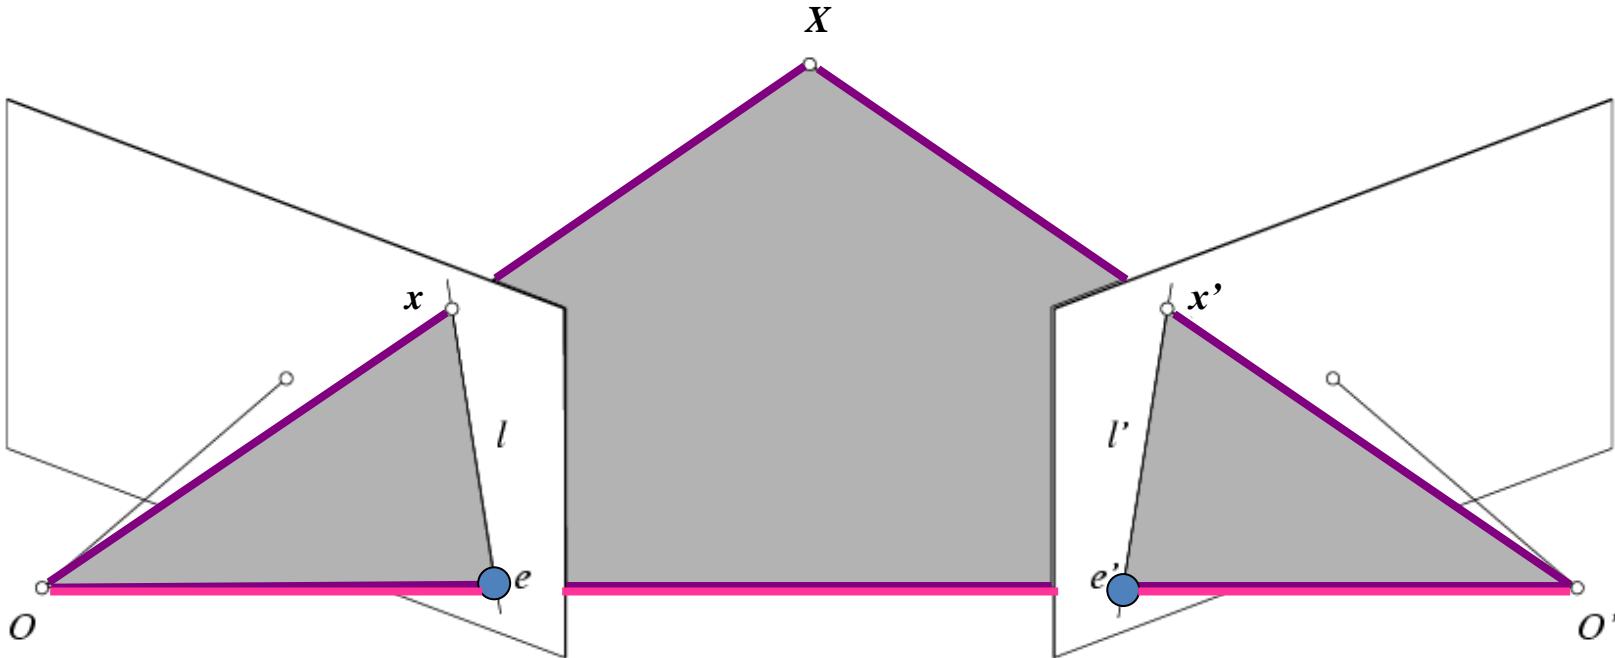

Potential matches for x' have to lie on the corresponding line l .

Wouldn't it be nice to know where matches can live? To constrain our 2d search to 1d.

VLFeat's 800 most confident matches
among 10,000+ local features.

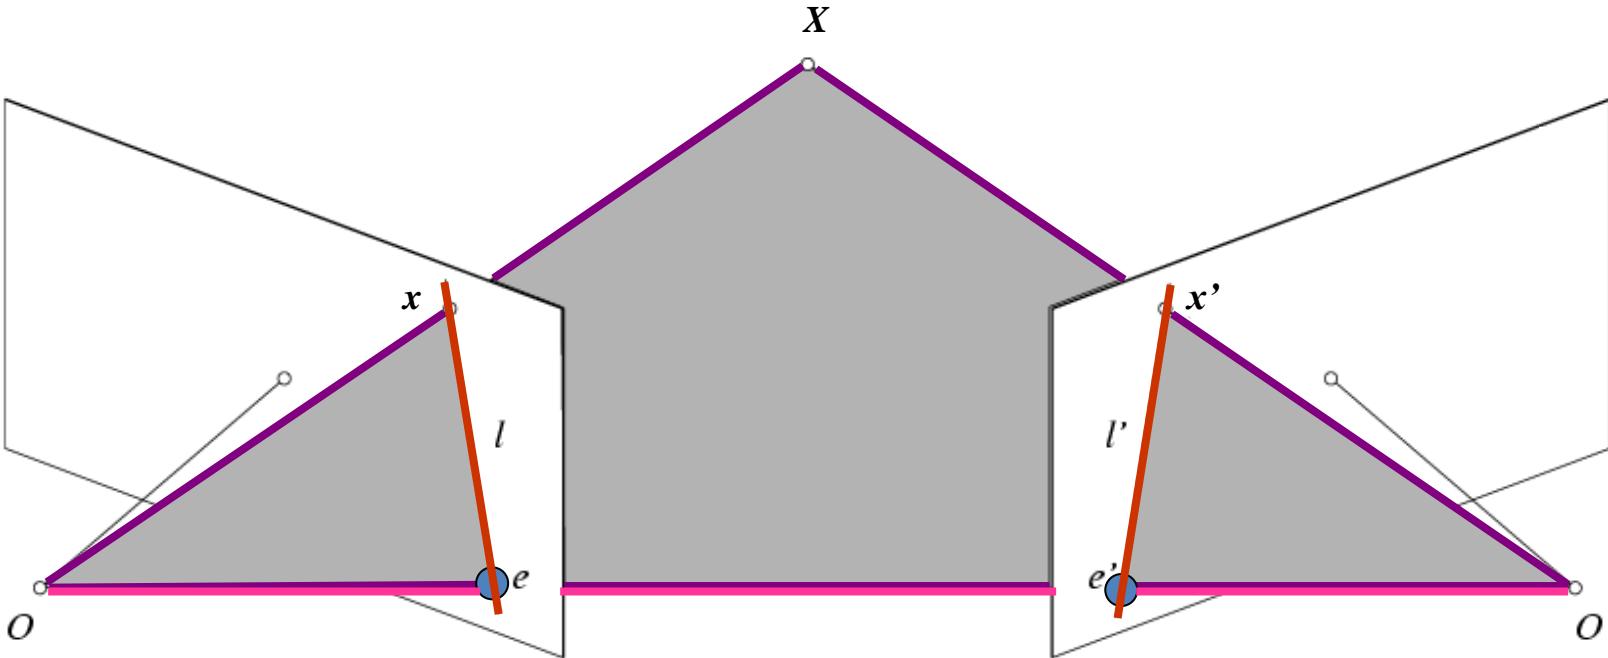

Epipolar geometry: notation

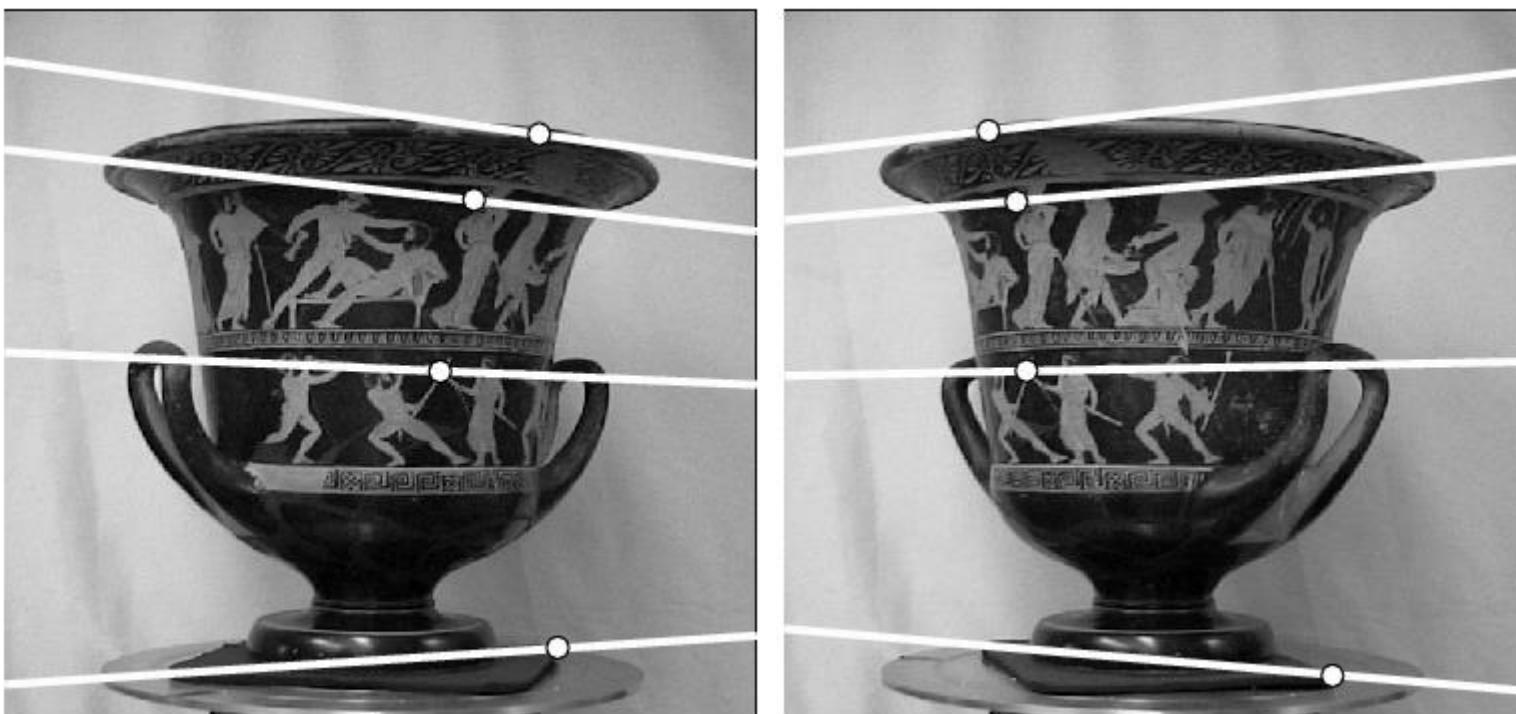

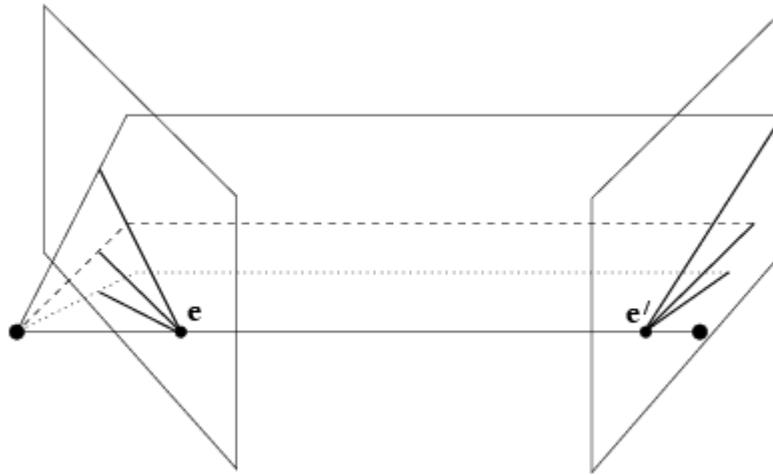

- **Baseline** – line connecting the two camera centers
- **Epipoles**
 - = intersections of baseline with image planes
 - = projections of the other camera center
- **Epipolar Plane** – plane containing baseline (1D family)

Epipolar geometry: notation

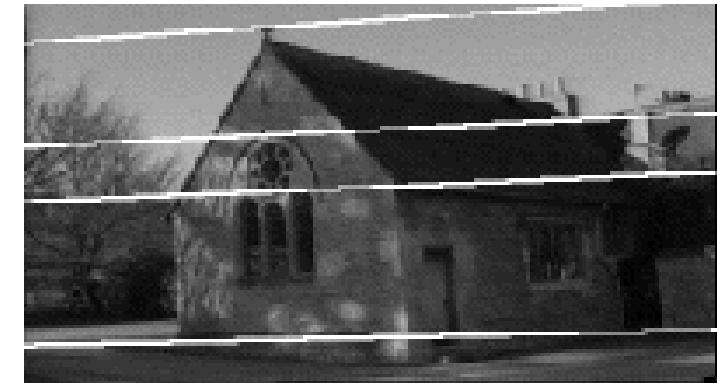

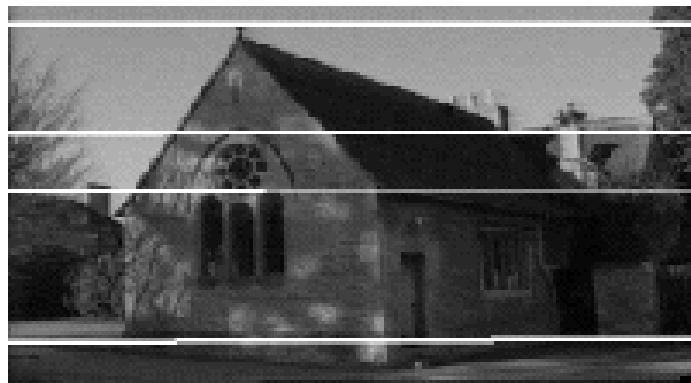

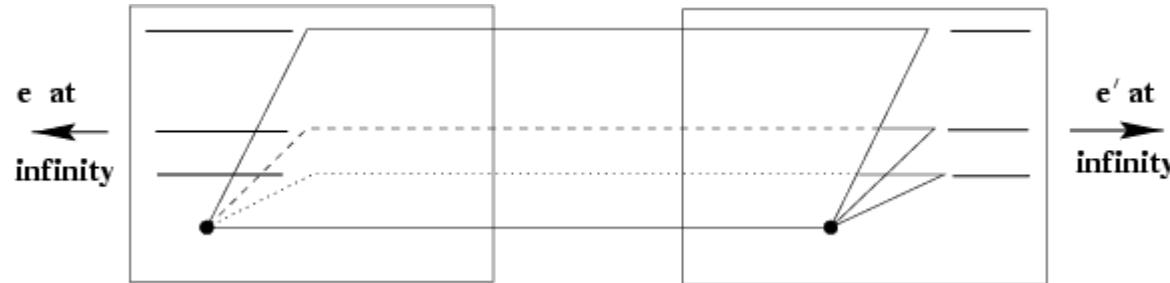

- **Baseline** – line connecting the two camera centers
- **Epipoles**
 - = intersections of baseline with image planes
 - = projections of the other camera center
- **Epipolar Plane** – plane containing baseline (1D family)
- **Epipolar Lines** - intersections of epipolar plane with image planes (always come in corresponding pairs)

Example: Converging cameras

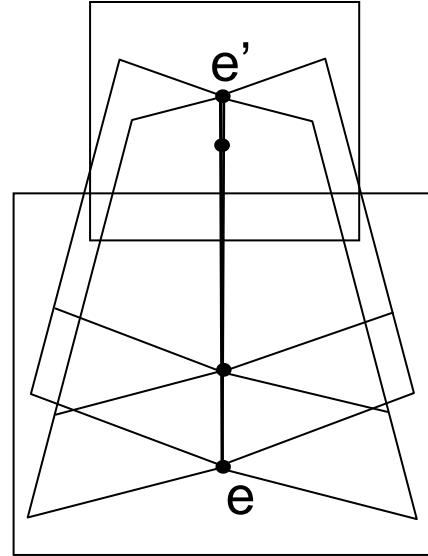

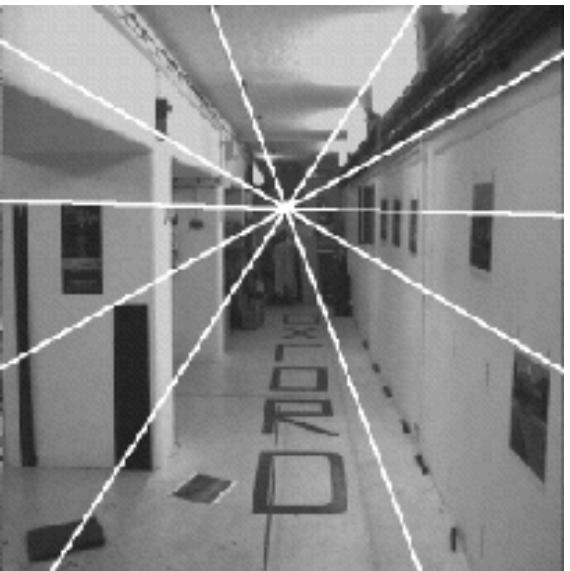

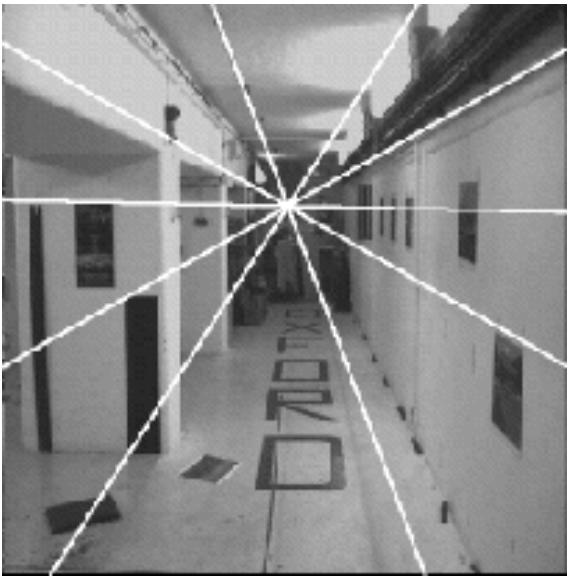

Example: Motion parallel to image plane

Example: Forward motion

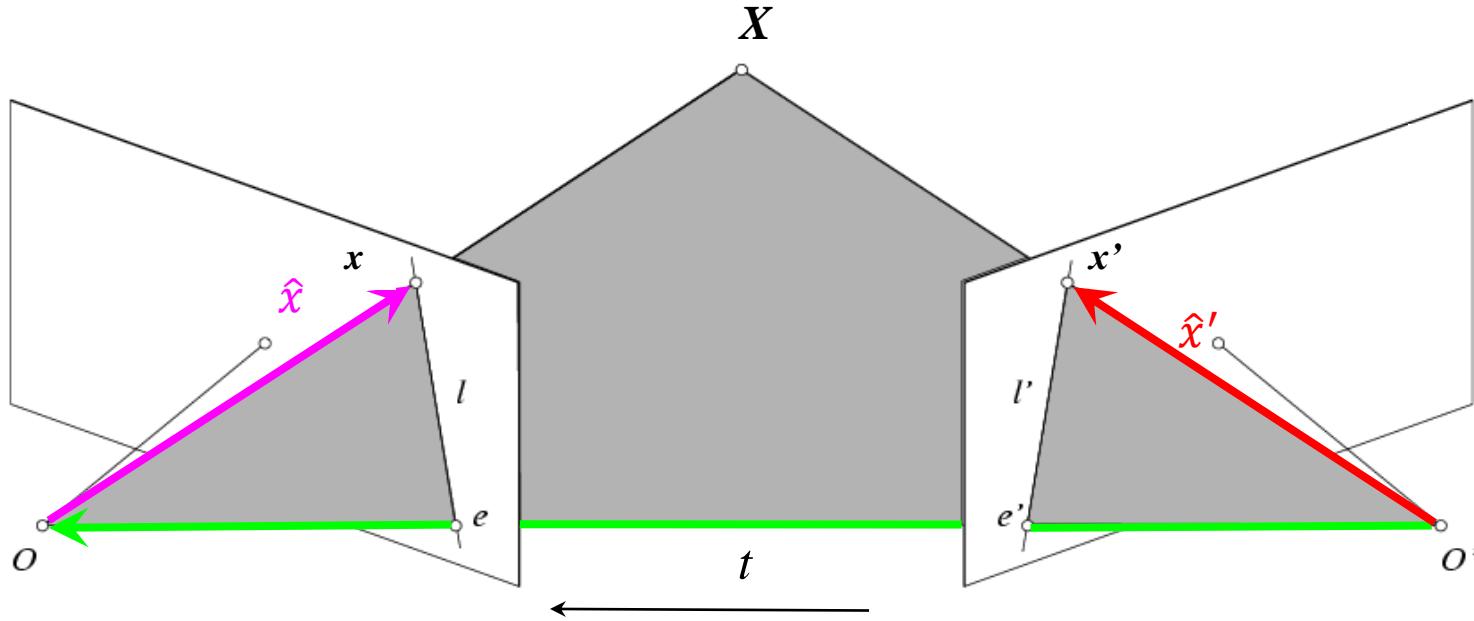

What would the epipolar lines look like if the camera moves directly forward?

Example: Forward motion

Epipole has same coordinates in both images.
Points move along lines radiating from e :
“Focus of expansion”

Epipolar constraint: Calibrated case

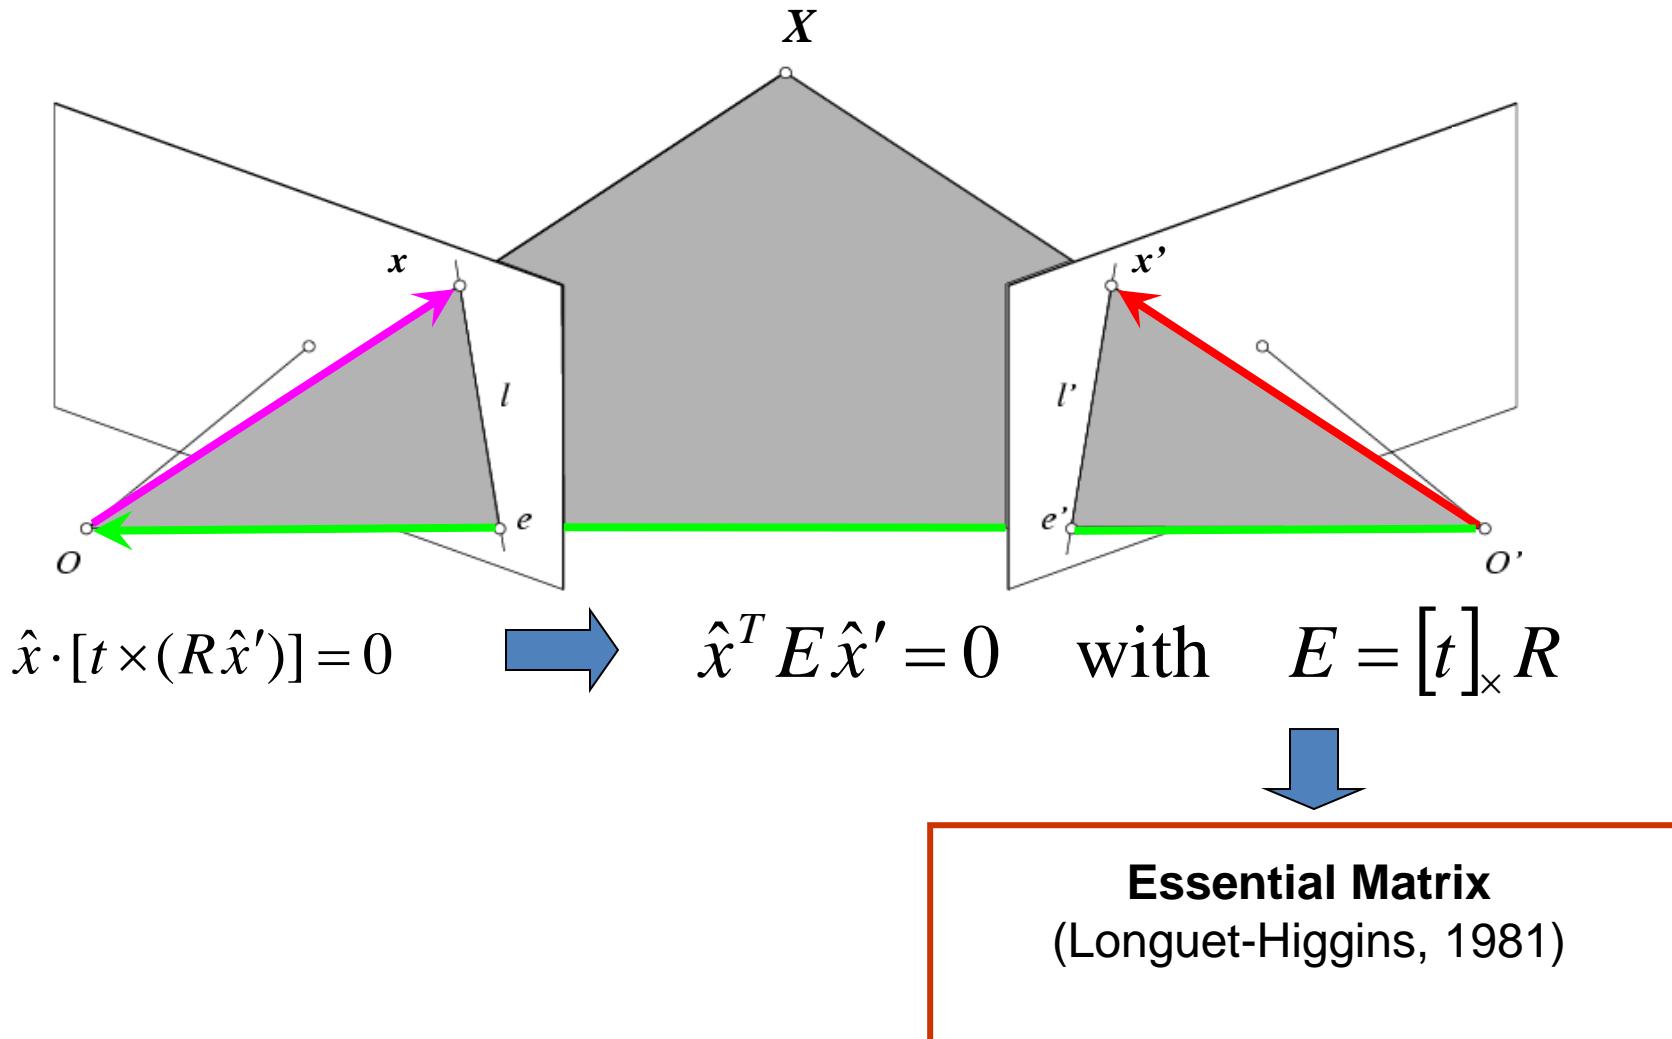

$$\hat{x} = K^{-1}x = X$$

$$\hat{x}' = K'^{-1}x' = X'$$

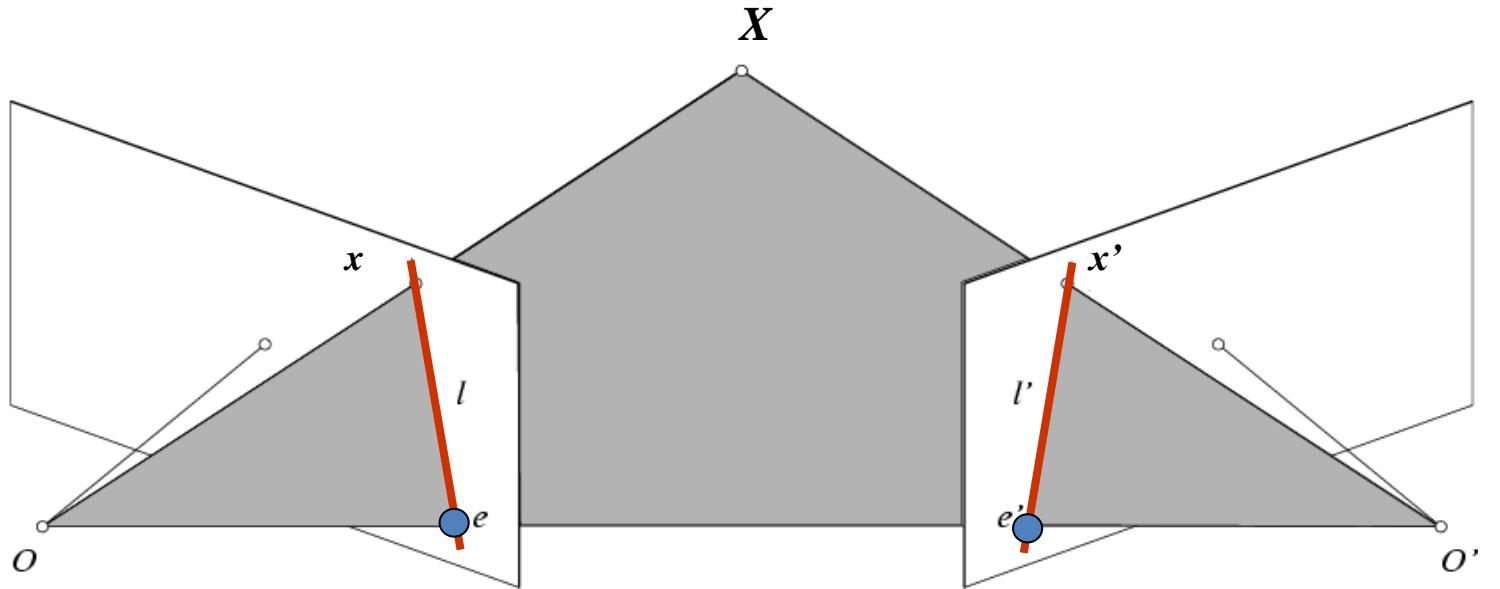

$$\hat{x} \cdot [t \times (R\hat{x}')] = 0$$

(because \hat{x} , $R\hat{x}'$, and t are co-planar)

Essential matrix

Properties of the Essential matrix

$$\hat{x} \cdot [t \times (R \hat{x}')] = 0 \quad \xrightarrow{\text{Drop } \hat{\text{}} \text{ below to simplify notation}} \quad \hat{x}^T E \hat{x}' = 0 \quad \text{with} \quad E = [t]_x R$$

Drop $\hat{\text{}}$ below to simplify notation

- $E x'$ is the epipolar line associated with x' ($l = E x'$)
- $E^T x$ is the epipolar line associated with x ($l' = E^T x$)
- $E e' = 0$ and $E^T e = 0$
- E is singular (rank two)
- E has five degrees of freedom
 - (3 for R , 2 for t because it's up to a scale)

Skew-symmetric matrix

The Fundamental Matrix

Without knowing K and K' , we can define a similar relation using *unknown* normalized coordinates

$$\hat{x}^T E \hat{x}' = 0$$

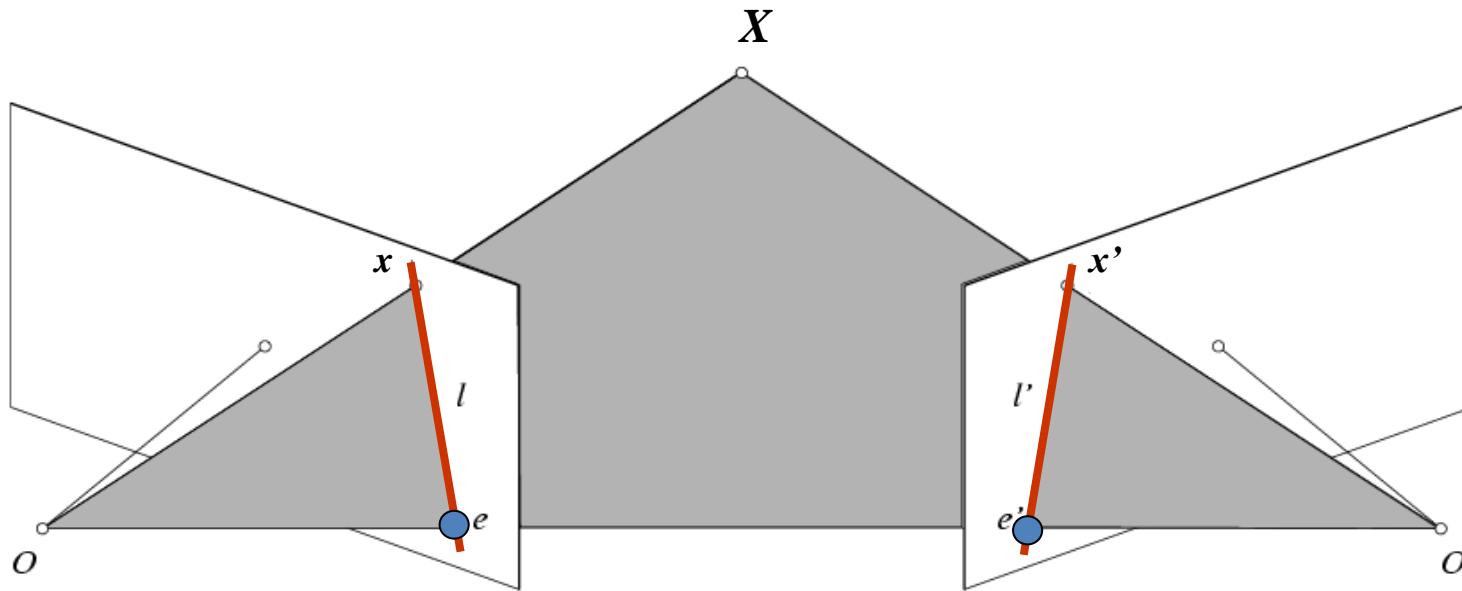

$$\hat{x} = K^{-1} x \quad \xrightarrow{\hspace{1cm}} \quad x^T F x' = 0 \quad \text{with} \quad F = K^{-T} E K'^{-1}$$

$$\hat{x}' = K'^{-1} x'$$

Fundamental Matrix
(Faugeras and Luong, 1992)

Properties of the Fundamental matrix

$$x^T F x' = 0 \quad \text{with} \quad F = K^{-T} E K'^{-1}$$

- $F x' = 0$ is the epipolar line associated with x'
- $F^T x = 0$ is the epipolar line associated with x
- $F e' = 0$ and $F^T e = 0$
- F is singular (rank two): $\det(F)=0$
- F has seven degrees of freedom: 9 entries but defined up to scale, $\det(F)=0$

Estimating the Fundamental Matrix

- 8-point algorithm
 - Least squares solution using SVD on equations from 8 pairs of correspondences
 - Enforce $\det(F)=0$ constraint using SVD on F
- 7-point algorithm
 - Use least squares to solve for null space (two vectors) using SVD and 7 pairs of correspondences
 - Solve for linear combination of null space vectors that satisfies $\det(F)=0$
- Minimize reprojection error
 - Non-linear least squares

Note: estimation of F (or E) is degenerate for a planar scene.

8-point algorithm

1. Solve a system of homogeneous linear equations
 - a. Write down the system of equations

$$\mathbf{x}^T F \mathbf{x}' = 0$$

$$uu'f_{11} + uv'f_{12} + uf_{13} + vu'f_{21} + vv'f_{22} + vf_{23} + u'f_{31} + v'f_{32} + f_{33} = 0$$

$$Af = \begin{bmatrix} u_1 u_1' & u_1 v_1' & u_1 & v_1 u_1' & v_1 v_1' & v_1 & u_1' & v_1' & 1 \\ \vdots & \vdots \\ u_n u_n' & u_n v_n' & u_n & v_n u_n' & v_n v_n' & v_n & u_n' & v_n' & 1 \end{bmatrix} \begin{bmatrix} f_{11} \\ f_{12} \\ f_{13} \\ f_{21} \\ \vdots \\ f_{33} \end{bmatrix} = \mathbf{0}$$

8-point algorithm

1. Solve a system of homogeneous linear equations
 - a. Write down the system of equations
 - b. Solve \mathbf{f} from $\mathbf{Af=0}$ using SVD

Matlab:

```
[U, S, V] = svd(A);  
f = V(:, end);  
F = reshape(f, [3 3])';
```

For python, see

`numpy.linalg.svd`

Need to enforce singularity constraint

Fundamental matrix has rank 2 : $\det(F) = 0$.

Left : Uncorrected F – epipolar lines are not coincident.

Right : Epipolar lines from corrected F .

8-point algorithm

1. Solve a system of homogeneous linear equations
 - a. Write down the system of equations
 - b. Solve \mathbf{f} from $\mathbf{Af}=\mathbf{0}$ using SVD

Matlab:

```
[U, S, V] = svd(A);  
f = V(:, end);  
F = reshape(f, [3 3])';
```

2. Resolve $\det(\mathbf{F}) = 0$ constraint using SVD

Matlab:

```
[U, S, V] = svd(F);  
S(3, 3) = 0;  
F = U*S*V';
```

For python, see
`numpy.linalg.svd`

8-point algorithm

1. Solve a system of homogeneous linear equations
 - a. Write down the system of equations
 - b. Solve \mathbf{f} from $\mathbf{A}\mathbf{f}=\mathbf{0}$ using SVD
2. Resolve $\det(\mathbf{F}) = 0$ constraint by SVD

Notes:

- Use RANSAC to deal with outliers (sample 8 points)
 - How to test for outliers?

Problem with eight-point algorithm

$$\begin{bmatrix} u'u & u'v & u' & v'u & v'v & v' & u & v \end{bmatrix} \begin{bmatrix} f_{11} \\ f_{12} \\ f_{13} \\ f_{21} \\ f_{22} \\ f_{23} \\ f_{31} \\ f_{32} \end{bmatrix} = -1$$

Problem with eight-point algorithm

135384.58	75411.13	198.72	411350.03	229127.78	603.79	681.28	379.48

$$\begin{bmatrix} f_{11} \\ f_{12} \\ f_{13} \\ f_{21} \\ f_{22} \\ f_{23} \\ f_{31} \\ f_{32} \end{bmatrix} = -1$$

Poor numerical conditioning

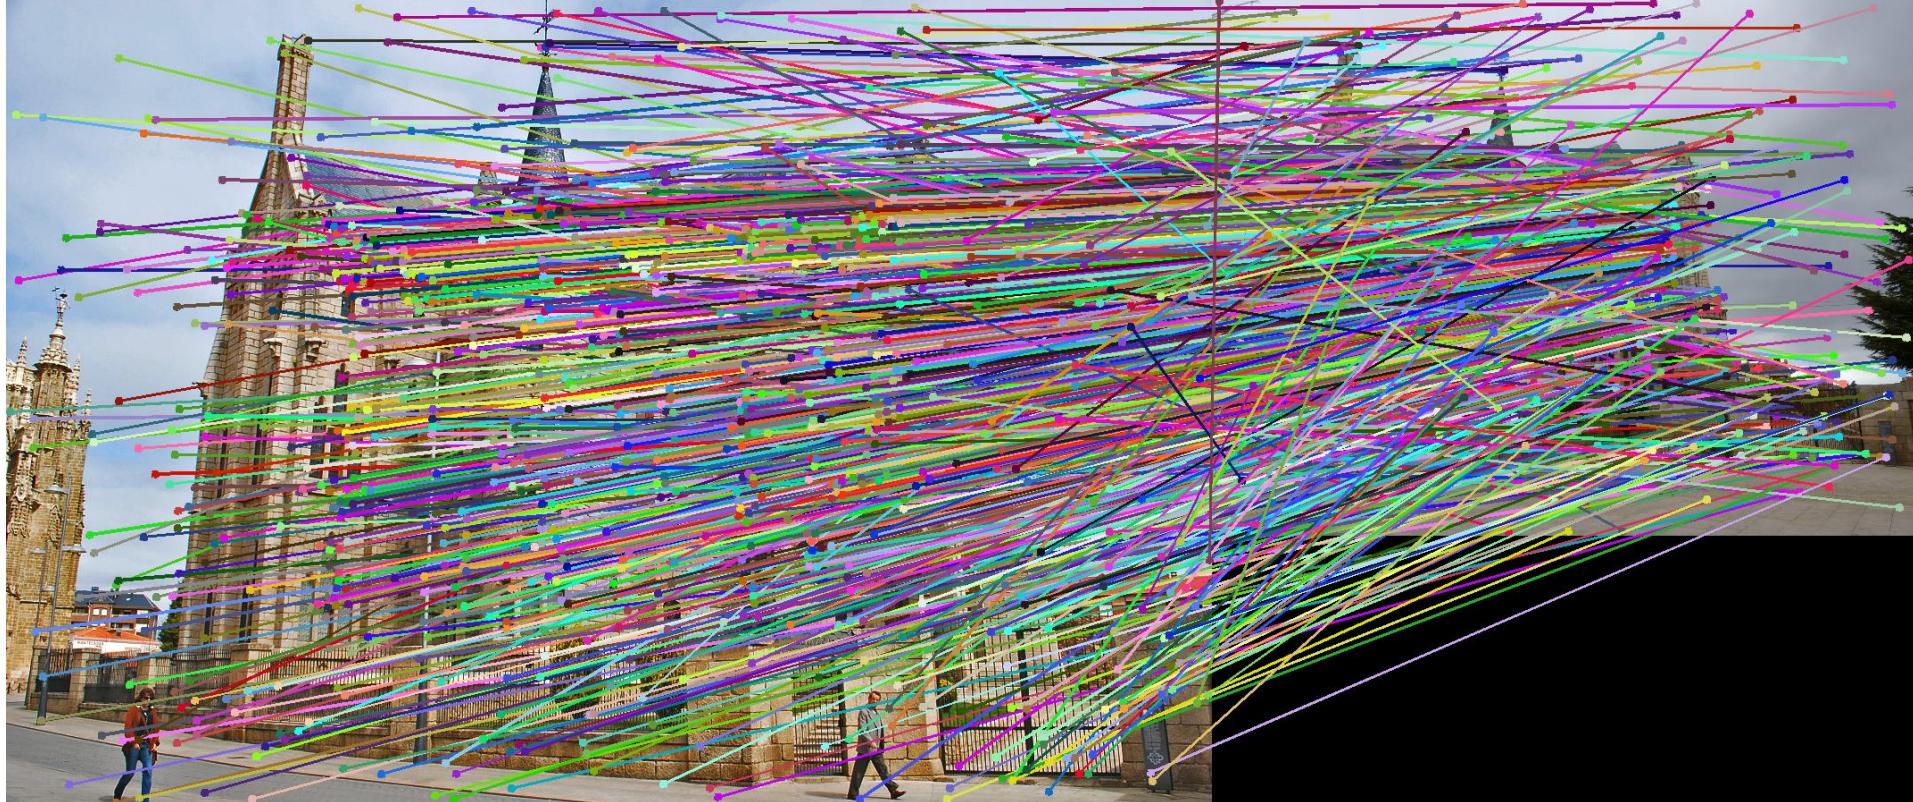

Can be fixed by rescaling the data

The normalized eight-point algorithm

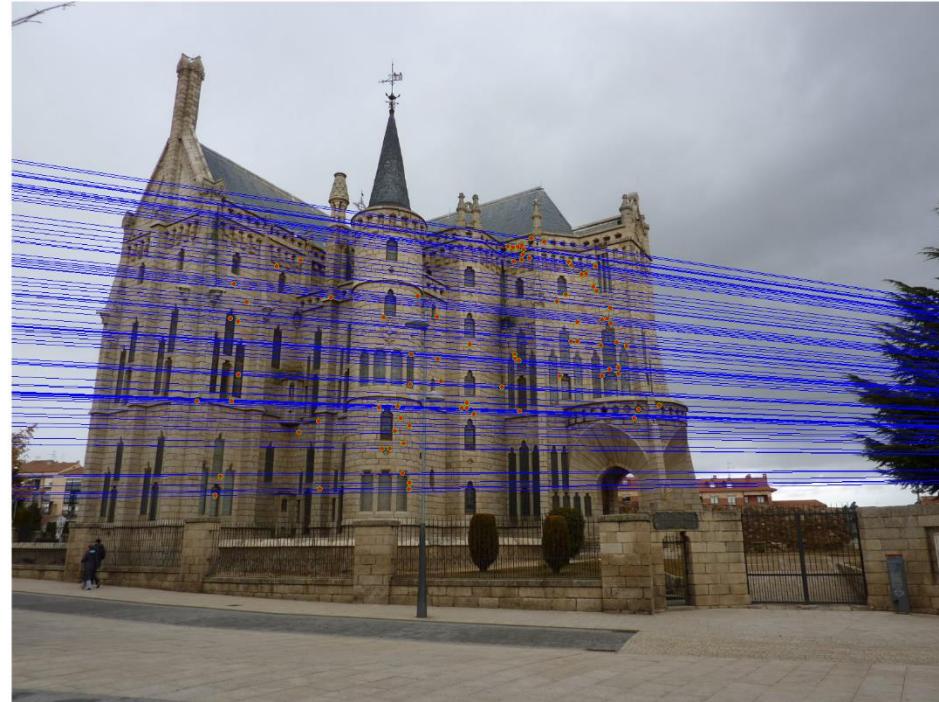

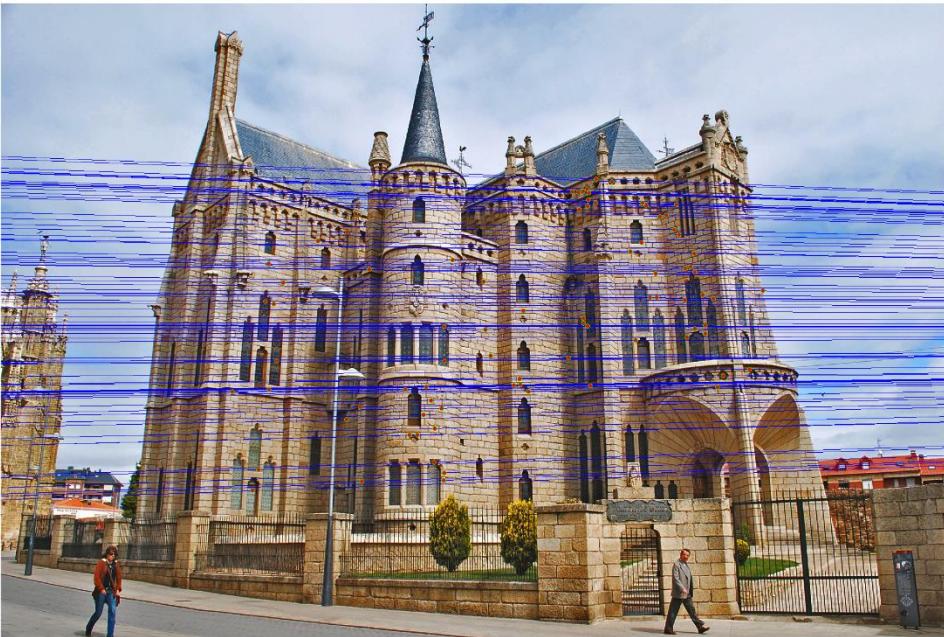

(Hartley, 1995)

- Center the image data at the origin, and scale it so the mean squared distance between the origin and the data points is 2 pixels
- Use the eight-point algorithm to compute \mathbf{F} from the normalized points
- Enforce the rank-2 constraint (for example, take SVD of \mathbf{F} and throw out the smallest singular value)
- Transform fundamental matrix back to original units: if \mathbf{T} and \mathbf{T}' are the normalizing transformations in the two images, than the fundamental matrix in original coordinates is $\mathbf{T}'^T \mathbf{F} \mathbf{T}$

VLFeat's 800 most confident matches
among 10,000+ local features.

Epipolar lines

Keep only the matches at are “inliers” with respect to the “best” fundamental matrix
