

The blue and green colors are actually the same

Hybrid Images

- A. Oliva, A. Torralba, P.G. Schyns, ["Hybrid Images,"](#) SIGGRAPH 2006

Why do we get different, distance-dependent interpretations of hybrid images?

Recap of Filtering Discussion from Previous Lecture

- Linear filtering is dot product at each position
 - Not a matrix multiplication
 - Can smooth, sharpen, translate (among many other uses)
 - Linear filters “*look for*” features that *resemble the filter itself*
- Be aware of details for filter size, extrapolation, cropping

1	0	-1
2	0	-2
1	0	-1

Why do we care so much about filtering/convolution?

- Pixels are individually weak and noisy signals. Reasoning over neighborhoods helps.

Surely there are other ways to extract information from images?

- Yes, but they may be more brittle, slower to compute, or less easy to plug into machine learning tools.

Alternative to Filtering - Viola Jones Face Detection

Figure 1: Example rectangle features shown relative to the enclosing detection window. The sum of the pixels which lie within the white rectangles are subtracted from the sum of pixels in the grey rectangles. Two-rectangle features are shown in (A) and (B). Figure (C) shows a three-rectangle feature, and (D) a four-rectangle feature.

Figure 3: The first and second features selected by AdaBoost. The two features are shown in the top row and then overlayed on a typical training face in the bottom row. The first feature measures the difference in intensity between the region of the eyes and a region across the upper cheeks. The feature capitalizes on the observation that the eye region is often darker than the cheeks. The second feature compares the intensities in the eye regions to the intensity across the bridge of the nose.

Alternative to Filtering – Non-overlapping Patches

Filtering vs. Convolution

f =filter, size $k \times l$

I =image, size $m \times n$

h =output, size $m \times n$

- 2d filtering

$$h[m,n] = \sum_{k,l} f[k,l] I[m+k,n+l]$$

- 2d convolution

$$h[m,n] = \sum_{k,l} f[k,l] I[m-k,n-l]$$

In Python you can use <https://docs.scipy.org/doc/scipy/reference/generated/scipy.signal.convolve2d.html>

Key properties of linear filters

Linearity:

$$\text{imfilter}(I, f_1 + f_2) = \text{imfilter}(I, f_1) + \text{imfilter}(I, f_2)$$

Shift invariance: same behavior regardless of pixel location

$$\text{imfilter}(\text{shift}(I), f) = \text{shift}(\text{imfilter}(I, f))$$

Any linear, shift-invariant operator can be represented as a convolution

More properties

- Commutative: $a * b = b * a$
 - Conceptually no difference between filter and signal
 - But *spatial* filtering implementations typically break this equality
- Associative: $a * (b * c) = (a * b) * c$
 - Often apply several filters one after another: $((a * b_1) * b_2) * b_3$
 - This is equivalent to applying one filter: $a * (b_1 * b_2 * b_3)$
- Distributes over addition: $a * (b + c) = (a * b) + (a * c)$
- Scalars factor out: $ka * b = a * kb = k(a * b)$
- Identity: unit impulse $e = [0, 0, 1, 0, 0]$,
 $a * e = a$

Median filters

- A **Median Filter** operates over a window by selecting the median intensity in the window.
- What advantage does a median filter have over a mean filter?
- Is a median filter a kind of convolution?

IEEE JOURNAL OF SOLID-STATE CIRCUITS, VOL. 23, NO. 2, APRIL 1988

Design of an Image Edge Detection Filter Using the Sobel Operator

NICK KANOPOULOS, MEMBER, IEEE, NAGESH VASANTHAVADA, MEMBER, IEEE,
AND ROBERT L. BAKER

Abstract—This paper presents the design and implementation of a monolithic image edge detection filter using the Sobel operators. The chip architecture is highly pipelined in performing the computations of gradient magnitude and direction for the output image samples. The chip design is based on a 2- μm , double-metal, CMOS technology and was implemented using a silicon compiler system in less than 2 man months. It is designed to operate with a 10-MHz two-phase clock, and it performs approximately 200×10^6 additions/s to provide the required magnitude and direction outputs every clock cycle. The function of the chip has been demonstrated with a prototype system that is performing image edge detection in real time.

I. INTRODUCTION

CONTINUING advances in VLSI technology have made it attractive to implement complex, algorithm-specific image processing functions on a single chip to obtain high performance while minimizing size and power requirements at the system level. Even though parallel image processing systems using off-the-shelf digital signal processors have been reported in the literature recently [1],

Once an object or region has been located, it is examined for identifying features that can lead to final classification of targets. Any identified target can then be tracked through subsequent images.

Before an image can be segmented, the objects in that image must be detected and roughly classified as to shape and boundary characteristics. Some techniques used to detect objects use a gradient operator to locate potential object boundaries or edges. The gradient operator applied to a continuous function produces a vector at each point whose direction gives the direction of the maximum change of the function at that point, and whose magnitude gives the magnitude of this maximum change. A digital gradient is often computed by convolving two windows with an image, one window giving the x component g_x of the gradient, and the other giving the y component g_y . This operation can be described by the expressions

$$g_x(i, j) = \text{mask}_x * l(i, j), \quad g_y = \text{mask}_y * l(i, j) \quad (1)$$

the magnitude of this maximum change. A digital gradient is often computed by convolving two windows with an image, one window giving the x component g_x of the gradient, and the other giving the y component g_y . This operation can be described by the expressions

$$g_x(i, j) = \text{mask}_x * l(i, j), \quad g_y = \text{mask}_y * l(i, j) \quad (1)$$

where $l(i, j)$ is indicating some neighborhood of pixel (i, j) , and $*$ denotes convolution. Fig. 2 illustrates an example of this operation.

plifies the directional computation. The gradient magnitude

$$\text{Mag} = [E_H^2 + E_V^2]^{1/2} \quad (2)$$

$$E_H = \begin{bmatrix} -1 & -2 & -1 \\ 0 & 0 & 0 \\ 1 & 2 & 1 \end{bmatrix} * I$$

$$E_V = \begin{bmatrix} -1 & 0 & 1 \\ -2 & 0 & 2 \\ -1 & 0 & 1 \end{bmatrix} * I$$

$$A = (x^2 + y^2)^{\frac{1}{2}}$$

Fig. 3. Example for Euclidean norm approximation.

Can we do Sobel filter edge detection in a single filtering step?

No.

History and definition of the so-called "Sobel Operator", more appropriately named the Sobel-Feldman Operator. ResearchGate. <https://doi.org/10.13140/RG.2.1.1912.4965>

Review: questions

1. Write down a 3x3 filter that returns a negative value if the average value of the 4-adjacent neighbors is less than the center and a positive value otherwise (and zero if they are the same)
2. Write down a filter that will compute the gradient in the x-direction:

$$\text{gradx}(y, x) = \text{im}(y, x+1) - \text{im}(y, x) \quad \text{for each } x, y$$

Background: Change of Basis

For vectors and for image patches

Related concept: Image Compression

How is it that a 4MP image can be compressed to a few hundred KB without a noticeable change?

Lossy Image Compression (JPEG)

Block-based Discrete Cosine Transform (DCT)

<https://en.wikipedia.org/wiki/JPEG>

Using DCT in JPEG

- The first coefficient $B(0,0)$ is the DC component, the average intensity
- The top-left coeffs represent low frequencies, the bottom right – high frequencies

Lossy Image Compression (JPEG)

8x8 image patch

DCT bases

$$G = \begin{matrix} & \xrightarrow{u} \\ \begin{matrix} \downarrow v \\ \begin{bmatrix} -415.38 & -30.19 & -61.20 & 27.24 & 56.13 & -20.10 & -2.39 & 0.46 \\ 4.47 & -21.86 & -60.76 & 10.25 & 13.15 & -7.09 & -8.54 & 4.88 \\ -46.83 & 7.37 & 77.13 & -24.56 & -28.91 & 9.93 & 5.42 & -5.65 \\ -48.53 & 12.07 & 34.10 & -14.76 & -10.24 & 6.30 & 1.83 & 1.95 \\ 12.12 & -6.55 & -13.20 & -3.95 & -1.88 & 1.75 & -2.79 & 3.14 \\ -7.73 & 2.91 & 2.38 & -5.94 & -2.38 & 0.94 & 4.30 & 1.85 \\ -1.03 & 0.18 & 0.42 & -2.42 & -0.88 & -3.02 & 4.12 & -0.66 \\ -0.17 & 0.14 & -1.07 & -4.19 & -1.17 & -0.10 & 0.50 & 1.68 \end{bmatrix} \end{matrix} \end{matrix}$$

Patch representation after projecting on to DCT bases

Image compression using DCT

- Quantize
 - More coarsely for high frequencies (which also tend to have smaller values)
 - Many quantized high frequency values will be zero
- Encode
 - Can decode with inverse dct

Filter responses

$$G = \begin{matrix} & \xrightarrow{u} & \\ \begin{bmatrix} -415.38 & -30.19 & -61.20 & 27.24 & 56.13 & -20.10 & -2.39 & 0.46 \\ 4.47 & -21.86 & -60.76 & 10.25 & 13.15 & -7.09 & -8.54 & 4.88 \\ -46.83 & 7.37 & 77.13 & -24.56 & -28.91 & 9.93 & 5.42 & -5.65 \\ -48.53 & 12.07 & 34.10 & -14.76 & -10.24 & 6.30 & 1.83 & 1.95 \\ 12.12 & -6.55 & -13.20 & -3.95 & -1.88 & 1.75 & -2.79 & 3.14 \\ -7.73 & 2.91 & 2.38 & -5.94 & -2.38 & 0.94 & 4.30 & 1.85 \\ -1.03 & 0.18 & 0.42 & -2.42 & -0.88 & -3.02 & 4.12 & -0.66 \\ -0.17 & 0.14 & -1.07 & -4.19 & -1.17 & -0.10 & 0.50 & 1.68 \end{bmatrix} & \downarrow v \end{matrix}$$

Quantized values

$$B = \begin{bmatrix} -26 & -3 & -6 & 2 & 2 & -1 & 0 & 0 \\ 0 & -2 & -4 & 1 & 1 & 0 & 0 & 0 \\ -3 & 1 & 5 & -1 & -1 & 0 & 0 & 0 \\ -3 & 1 & 2 & -1 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

Quantization table

$$Q = \begin{bmatrix} 16 & 11 & 10 & 16 & 24 & 40 & 51 & 61 \\ 12 & 12 & 14 & 19 & 26 & 58 & 60 & 55 \\ 14 & 13 & 16 & 24 & 40 & 57 & 69 & 56 \\ 14 & 17 & 22 & 29 & 51 & 87 & 80 & 62 \\ 18 & 22 & 37 & 56 & 68 & 109 & 103 & 77 \\ 24 & 35 & 55 & 64 & 81 & 104 & 113 & 92 \\ 49 & 64 & 78 & 87 & 103 & 121 & 120 & 101 \\ 72 & 92 & 95 & 98 & 112 & 100 & 103 & 99 \end{bmatrix}$$

JPEG Compression Summary

1. Convert image to YCrCb
2. Subsample color
 - People have bad spatial sensitivity for color
3. Split into blocks (8x8, typically), subtract 128
4. For each block
 - a. Compute DCT coefficients
 - b. Coarsely quantize
 - Many high frequency components will become zero
5. Use run-length encoding to take advantage of runs of zeros
6. Use Huffman Coding to take advantage of frequent tokens

<http://en.wikipedia.org/wiki/JPEG>

The Fourier Transform

Jean Baptiste Joseph Fourier (1768-1830)

had crazy idea (1807):

Any univariate function can be rewritten as a weighted sum of sines and cosines of different frequencies.

...the manner in which the author arrives at these equations is not exempt of difficulties and...his analysis to integrate them still leaves something to be desired on the score of generality and even rigour.

- Don't believe it?
 - Neither did Lagrange, Laplace, Poisson and other big wigs
 - Not translated into English until 1878!
- But it's (mostly) true!
 - called Fourier Series
 - there are some subtle restrictions

Fourier, Joseph (1768-1830)

© 1996-2007 Eric W. Weisstein

French mathematician who discovered that any periodic motion can be written as a superposition of sinusoidal and cosinusoidal vibrations. He developed a mathematical theory of [heat](#) 🔥 in *Théorie Analytique de la Chaleur* (*Analytic Theory of Heat*), (1822), discussing it in terms of differential equations.

Fourier was a friend and advisor of Napoleon. [Fourier](#) believed that his health would be improved by wrapping himself up in blankets, and in this state he tripped down the stairs in his house and killed himself. The paper of [Galois](#) which he had taken home to read shortly before his death was never recovered.

How would math have changed if the Slanket or Snuggie had been invented?

A sum of sines

Our building block:

$$A \sin(\omega x + \phi)$$

Add enough of them to get
any signal $g(x)$ you want!

$$f(\text{target}) = f_1 + f_2 + f_3 + \dots + f_n + \dots$$

Frequency Spectra

- example : $g(t) = \sin(2\pi f t) + (1/3)\sin(2\pi(3f) t)$

Frequency Spectra

Frequency Spectra

Frequency Spectra

Frequency Spectra

Frequency Spectra

Frequency Spectra

Frequency Spectra

=

$$A \sum_{k=1}^{\infty} \frac{1}{k} \sin(2\pi kt)$$

Example: Music

- We think of music in terms of frequencies at different magnitudes

Example: Speech as a Spectrogram

Spectrogram of the spoken words "nineteenth century". Frequencies are shown increasing up the vertical axis, and time on the horizontal axis. The legend to the right shows that the color intensity increases with the density.

<https://en.wikipedia.org/wiki/Spectrogram>

Other signals

- We can also think of all kinds of other signals the same way

Fourier Transform

- Fourier transform stores the magnitude and phase at each frequency
 - Magnitude encodes how much signal there is at a particular frequency
 - Phase encodes spatial information (indirectly)
 - This is often notated in terms of real and complex numbers

Amplitude: $A = \pm \sqrt{R(\omega)^2 + I(\omega)^2}$

Phase: $\phi = \tan^{-1} \frac{I(\omega)}{R(\omega)}$

Computing the Fourier Transform

$$H(\omega) = \mathcal{F} \{h(x)\} = Ae^{j\phi}$$

Continuous

$$H(\omega) = \int_{-\infty}^{\infty} h(x)e^{-j\omega x} dx$$

Discrete

$$H(k) = \frac{1}{N} \sum_{x=0}^{N-1} h(x)e^{-j\frac{2\pi kx}{N}}$$

$$k = -N/2..N/2$$

Fast Fourier Transform (FFT): $N \log N$

Euler's Formula

But what is the Fourier Transform? A visual introduction.

DCT bases

$$G = \begin{matrix} & \xrightarrow{u} & \\ \begin{matrix} \downarrow v \\ \end{matrix} & \begin{bmatrix} -415.38 & -30.19 & -61.20 & 27.24 & 56.13 & -20.10 & -2.39 & 0.46 \\ 4.47 & -21.86 & -60.76 & 10.25 & 13.15 & -7.09 & -8.54 & 4.88 \\ -46.83 & 7.37 & 77.13 & -24.56 & -28.91 & 9.93 & 5.42 & -5.65 \\ -48.53 & 12.07 & 34.10 & -14.76 & -10.24 & 6.30 & 1.83 & 1.95 \\ 12.12 & -6.55 & -13.20 & -3.95 & -1.88 & 1.75 & -2.79 & 3.14 \\ -7.73 & 2.91 & 2.38 & -5.94 & -2.38 & 0.94 & 4.30 & 1.85 \\ -1.03 & 0.18 & 0.42 & -2.42 & -0.88 & -3.02 & 4.12 & -0.66 \\ -0.17 & 0.14 & -1.07 & -4.19 & -1.17 & -0.10 & 0.50 & 1.68 \end{bmatrix} \end{matrix}$$

Patch representation after
projecting on to DCT bases

Man-made Scene

Can change spectrum, then reconstruct

Low and High Pass filtering

Reminder

- The Fourier transform can be thought of as a change of basis onto which “building blocks”?

The Convolution Theorem

- The Fourier transform of the convolution of two functions is the product of their Fourier transforms

$$F[g * h] = F[g]F[h]$$

- **Convolution** in spatial domain is equivalent to **multiplication** in frequency domain!

$$g * h = F^{-1}[F[g]F[h]]$$
