Introduction

- Basically we can describe Bayesian inference through repeated use of the sum and product rules
- Using a graphical / diagrammatical representation is often useful
 - 1 A way to visualize structure and consider relations
 - 2 Provides insights into a model and possible independence
 - 3 Allow us to leverage of the many graphical algorithms available
- Will consider both directed and undirected models
- This is a very rich areas with numerous good references

- 14 Summary

Bayesian Networks

- Consider the joint probability $p(a, b, c)$
- Using product rule we can rewrite it as

$$p(a, b, c) = p(c|a, b)p(a, b)$$

- Which again can be changed to

$$p(a, b, c) = p(c|a, b)p(b|a)p(a)$$

- We can illustrate this as

Bayesian Networks

- Nodes represent variables
- Arcs/links represent conditional dependence
- We can use the decomposition for any joint distribution.
- The direct / brute-force application generates fully connected graphs
- We can represent much more general relations

Example with "sparse" connections

- We can represent relations such as

$$p(x_1)p(x_2)p(x_3)p(x_4|x_1, x_2, x_3)p(x_5|x_1, x_3)p(x_6|x_4)p(x_7|x_4, x_5)$$

- Which is shown below

The general case

- We can think of this as coding the *factors*

$$p(x_k | pa_k)$$

where pa_k is the set of parents to a variable x_k

- The inference is then

$$p(\mathbf{x}) = \prod_k p(x_k | pa_k)$$

we will refer to this as factorization

- There can be no directed cycles in the graph
- The general form is termed a *directed acyclic graph* - DAG

Basic example

- We have seen the polynomial regression before

$$p(\mathbf{t}, \mathbf{w}) = p(\mathbf{w}) \prod_n p(t_n | \mathbf{w})$$

- Which can be visualized as

Bayesian Regression

- We can make the parameters and variables explicit

$$p(\mathbf{t}, \mathbf{w} | \mathbf{x}, \alpha, \sigma^2) = p(\mathbf{w} | \alpha) \prod_n p(t_n | \mathbf{w}, x_n, \sigma^2)$$

as shown here

Bayesian Regression - Learning

- When entering data we can condition inference on it

$$p(\mathbf{w}|\mathbf{t}) \propto p(\mathbf{w}) \prod_n p(t_n|\mathbf{w})$$

Generative Models - Example Image Synthesis

Discrete Variables - 1

- General joint distribution has $K^2 - 1$ parameters (for K possible outcomes)

$$p(\mathbf{x}_1, \mathbf{x}_2 | \mu) = \prod_{i=1}^K \prod_{j=1}^K \mu_{ij}^{x_{1i} x_{2j}}$$

- Independent joint distributions have $2(K - 1)$ parameters

$$p(\mathbf{x}_1, \mathbf{x}_2 | \mu) = \prod_{i=1}^K \mu_{1i}^{x_{1i}} \prod_{j=1}^K \mu_{2j}^{x_{2j}}$$

Discrete Variables - 2

- General joint distribution over M variables will have $K^M - 1$ parameters
- A Markov chain with M nodes will have $K - 1 + (M - 1)K(K - 1)$ parameters

Discrete Variables - Bayesian Parns

- The parameters can be modelled explicitly

$$p(\{\mathbf{x}_m, \mu_m\}) = p(\mathbf{x}_1 | \mu_1) p(\mu_1) \prod_{m=2}^M p(x_m | x_{m-1}, \mu_m) p(\mu_m)$$

- It is assumed that $p(\mu_m)$ is a Dirachlet

Discrete Variables - Bayesian Parns (2)

- For shared parameters the situation is simpler

$$p(\{\mathbf{x}_m\}, \mu_1, \mu) = p(\mathbf{x}_1 | \mu_1) p(\mu_1) \prod_{m=2}^M p(x_m | x_{m-1}, \mu) p(\mu)$$

Extension to Linear Gaussian Models

- The model can be extended to have each node as a Gaussian process/variable that is a linear function of its parents

$$p(x_i | pa_i) = N \left(x_i \mid \sum_{j \in pa_i} w_{ij} x_j + b_i, v_i \right)$$

- 13 Example
- 14 Summary

Conditional Independence

- Considerations of independence is important as part of the analysis and setup of a system
- As an example a is independent of b given c

$$p(a|b, c) = p(a|c)$$

- Or equivalently

$$\begin{aligned} p(a, b|c) &= p(a|b, c)p(b|c) \\ &= p(a|c)p(b|c) \end{aligned}$$

- Frequent notation in statistics

$$a \perp\!\!\!\perp b|c$$

Conditional Independence - Case 1

$$p(a, b, c) = p(a|c)p(b|c)p(c)$$

$$p(a, b) = \sum_c p(a|c)p(b|c)p(c)$$

$$a \perp\!\!\!\perp b \mid \emptyset$$

Conditional Independence - Case 1

$$\begin{aligned}
 p(a, b|c) &= \frac{p(a, b, c)}{p(c)} \\
 &= p(a|c)p(b|c) \\
 a \perp\!\!\!\perp b & \mid c
 \end{aligned}$$

Conditional Independence - Case 2

$$p(a, b, c) = p(a)p(c|a)p(b|c)$$

$$p(a, b) = p(a) \sum_c p(c|a)p(b|c) = p(a)p(b|a)$$

$$a \perp\!\!\!\perp b | \emptyset$$

Conditional Independence - Case 2

$$\begin{aligned}
 p(a, b|c) &= \frac{p(a, b, c)}{p(c)} \\
 &= \frac{p(a)p(c|a)p(b|c)}{p(c)} \\
 &= p(a|c)p(b|c)
 \end{aligned}$$

$$a \perp\!\!\!\perp b | c$$

Conditional Independence - Case 3

$$p(a, b, c) = p(a)p(b)p(c|a, b)$$

$$p(a, b) = p(a)p(b)$$

$$a \perp\!\!\!\perp b \mid \emptyset$$

This is the opposite of Case 1 - when c unobserved

Conditional Independence - Case 3

$$\begin{aligned}
 p(a, b|c) &= \frac{p(a, b, c)}{p(c)} \\
 &= \frac{p(a)p(b)p(c|a, b)}{p(c)} \\
 a \perp\!\!\!\perp b & \mid c
 \end{aligned}$$

This is the opposite of Case 1 - when c observed

Diagnostics - Out of fuel?

$$p(G = 1 | B = 1, F = 1) = 0.8$$

$$p(G = 1 | B = 1, F = 0) = 0.2$$

$$p(G = 1 | B = 0, F = 1) = 0.2$$

$$p(G = 1 | B = 0, F = 0) = 0.1$$

$$B = \text{Battery} \quad p(B = 1) = 0.9$$

$$F = \text{Fuel Tank} \quad p(F = 1) = 0.9$$

$$G = \text{Fuel Gauge} \Rightarrow p(F = 0) = 0.1$$

Diagnostics - Out of fuel?

$$\begin{aligned}
 p(F = 0 | G = 0) &= \frac{p(G = 0 | F = 0)p(F = 0)}{p(G = 0)} \\
 &\approx 0.257
 \end{aligned}$$

Observing $G=0$ increased the probability of an empty tank

Diagnostics - Out of fuel?

$$\begin{aligned}
 p(F = 0 | G = 0, B = 0) &= \frac{p(G = 0 | B = 0, F = 0)p(F = 0)}{\sum p(G = 0 | B = 0, F)p(F)} \\
 &\approx 0.111
 \end{aligned}$$

Observing $B=0$ implies less likely empty tank

D-separation

- Consider non-intersecting subsets A , B , and C in a directed graph
- A path between subsets A and B is considered *blocked* if it contains a node such that:
 - 1 the arcs are head-to-tail or tail-to-tail and in the set C
 - 2 the arcs meet head-to-head and neither the node or its descendents are in the set C .
- If all paths between A and B are blocked then A is d-separated from B by C .
- If there is d-separation then all the variables in the graph satisfies $A \perp\!\!\!\perp B \mid C$

D-Separation - Discussion

Inference in graphical models

- Consider inference of $p(x, y)$ we can formulate this as

$$p(x, y) = p(x|y)p(y) = p(y|x)p(x)$$

- We can further marginalize

$$p(y) = \sum_{x'} p(y|x')p(x')$$

- Using Bayes Rule we can reverse the inference

$$p(x|y) = \frac{p(y|x)p(x)}{p(y)}$$

- Helpful as mechanisms for inference

Inference in graphical models

(a)

(b)

(c)

Inference on a chain

$$p(\mathbf{x}) = \frac{1}{Z} \psi_{1,2}(x_1, x_2) \psi_{2,3}(x_2, x_3) \cdots \psi_{N-1,N}(x_{N-1}, x_N)$$

$$p(x_n) = \sum_{x_1} \cdots \sum_{x_{n-1}} \sum_{x_{n+1}} \sum_{x_N} p(\mathbf{x})$$

Inference on a chain

$$p(x_n) = \frac{1}{Z} \underbrace{\left[\sum_{x_{n-1}} \psi_{n-1,n}(x_{n-1}, x_n) \cdots \left[\sum_{x_1} \psi_{1,2}(x_1, x_2) \right] \right]}_{\mu_a(x_n)} \underbrace{\left[\sum_{x_{n+1}} \psi_{n,n+1}(x_n, x_{n+1}) \cdots \left[\sum_{x_N} \psi_{N-1,N}(x_{N-1}, x_N) \right] \right]}_{\mu_b(x_n)}$$

Inference on a chain

$$\mu_a(x_n) = \sum_{x_{n-1}} \psi_{n-1,n}(x_{n-1}, x_n) \cdots \left[\sum_{x_1} \psi_{1,2}(x_1, x_2) \right]$$

$$= \sum_{x_{n-1}} \psi_{n-1,n}(x_{n-1}, x_n) \mu_a(x_{n-1})$$

$$\mu_b(x_n) = \sum_{x_{n+1}} \psi_{n,n+1}(x_n, x_{n+1}) \cdots \left[\sum_{x_N} \psi_{N-1,N}(x_{N-1}, x_N) \right]$$

$$= \sum_{x_{n+1}} \psi_{n,n+1}(x_n, x_{n+1}) \mu_b(x_{n+1})$$

Inference on a chain

$$\mu_a(x_2) = \sum_{x_1} \psi_{1,2}(x_1, x_2) \quad \mu_b(x_{N-1}) = \sum_{x_N} \psi_{N-1,N}(x_{N-1}, x_N)$$

$$Z = \sum_{x_n} \mu_a(x_n) \mu_b(x_n)$$

Inference on a chain

- To compute local marginals
 - Compute and store forward messages $\mu_a(x_n)$
 - Compute and store backward messages $\mu_b(x_n)$
 - Compute Z at all nodes
 - Compute

$$p(x_n) = \frac{1}{Z} \mu_a(x_n) \mu_b(x_n)$$

for all variables

Inference in trees

Undirected Tree

Directed Tree

Directed Polytree

Factor Graphs

$$p(\mathbf{x}) = f_a(x_1, x_2) f_b(x_1, x_2) f_c(x_2, x_3) f_d(x_3)$$

$$p(\mathbf{x}) = \prod_s f_s(\mathbf{x}_s)$$

Factor Graphs from Directed Graphs

$$p(x) = p(x_1)p(x_2) \\ p(x_3|x_1, x_2)$$

$$f(x_1, x_2, x_3) = \\ p(x_1)p(x_2)p(x_3|x_1, x_2)$$

$$f_a(x_1) = p(x_1) \\ f_b(x_2) = p(x_2) \\ f_c(x_1, x_2, x_3) = p(x_3|x_2, x_1)$$

Factor Graphs from Undirected Graphs

$$\psi(x_1, x_2, x_3)$$

$$f(x_1, x_2, x_3) \\ = \psi(x_1, x_2, x_3)$$

$$f_a(x_1, x_2, x_3) f_b(x_2, x_3) \\ = \psi(x_1, x_2, x_3)$$

The Sum-Product Algorithm

- Objective**
- exact, efficient algorithm for computing marginals
 - make allow multiple marginals to be computed efficiently
- Key Idea**
- The distributive Law

$$ab + ac = a(b + c)$$

The Sum-Product Algorithm

$$p(x) = \sum_{\mathbf{x} \setminus x} p(\mathbf{x})$$

$$p(\mathbf{x}) = \prod_{s \in \text{Ne}(x)} F_s(x, X_s)$$

The Sum-Product Algorithm

$$p(x) = \prod_{s \in \text{Ne}(x)} \left[\sum_{X_s} F_s(x, X_s) \right] = \prod_{s \in \text{Ne}(x)} \mu_{f_s \rightarrow x}(x)$$

$$\mu_{f_s \rightarrow x}(x) = \sum_{X_s} F_s(x, X_s)$$

The Sum-Product Algorithm

$$F_S(x, X_S) = f_s(x, x_1, \dots, x_M) G_1(x_1, X_{s1}) \dots G_M(x_M, X_{sM})$$

The Sum-Product Algorithm

$$\begin{aligned} \mu_{f_s \rightarrow x}(x) &= \sum_{x_1} \cdots \sum_{x_M} f_s(x, x_1, \dots, x_M) \prod_{m \in \text{Ne}(f_s) \setminus x} \left[\sum_{X_{sm}} G_m(x_m, X_{sm}) \right] \\ &= \sum_{x_1} \cdots \sum_{x_M} f_s(x, x_1, \dots, x_M) \prod_{m \in \text{Ne}(f_s) \setminus x} \mu_{x_m \rightarrow f_s}(x_m) \end{aligned}$$

The Sum-Product Algorithm

$$\begin{aligned}
 \mu_{x_m \rightarrow f_s}(x_m) \sum_{X_{sm}} G_m(x_m, X_{sm}) &= \sum_{X_{sm}} \prod_{l \in \text{Ne}(x_m) \setminus f_s} F_l(x_m, X_{lm}) \\
 &= \prod_{l \in \text{Ne}(x_m) \setminus f_s} \mu_{f_l \rightarrow x_m}(x_m)
 \end{aligned}$$

The Sum-Product Algorithm

Initialization

- For variable nodes

- For factor nodes

The Sum-Product Algorithm

- To compute local marginals
 - Pick an arbitrary node as root
 - Compute and propagate msgs from leafs to root (store msgs)
 - Compute and propagate msgs from root to leaf nodes (store msgs)
 - Compute products of received msgs and normalize as required
- Propagate up the tree and down again to compute all marginals (as needed)

Introduction

- There are many examples where we are processing sequential data
- Everyday examples include
 - Processing of stock data
 - Speech analysis
 - Traffic patterns
 - Gesture analysis
 - Manufacturing flow
- We cannot assume IID as a basis for analysis
- The Hidden Markov Model is frequently used

Apple Stock Quote Example

Markov model

- We have already talked about the Markov model.
- Estimation of joint probability as a sequential challenge

$$p(x_1, \dots, x_N) = \prod_{n=1}^N p(x_n | x_{n-1}, \dots, x_1)$$

- An Nth order model is dependent on the N last terms
- A 1st order model is then

$$P(x_1, \dots, x_N) = \prod_{n=1}^N p(x_n | x_{n-1})$$

- I.e.:

$$p(x_n | x_{n-1}, \dots, x_1) = p(x_n | x_{n-1})$$

Hidden Markov Model

Modelling of HMM's

- We can model the transition probabilities as a table

$$A_{jk} = p(z_{nk} = 1 | z_{n-1,j} = 1)$$

- The conditionals are then (with a 1-out-of-K coding)

$$p(z_n | z_{n-1}, A) = \prod_{k=1}^K \prod_{j=1}^K A_{jk}^{z_{n-1,j} z_{nk}}$$

- The per element probability is expressed by $\pi_k = p(z_{1k} = 1)$

$$p(z_1 | \pi) = \prod_{k=1}^K \pi_k^{z_{1k}}$$

with $\sum_k \pi_k = 1$

- 14 Summary

Maximum likelihood for the HMM

- If we observe a set of data $X = \{x_1, \dots, x_N\}$ we can estimate the parameters using ML

$$p(X|\theta) = \prod_Z p(X, Z|\theta)$$

- I.e. summation of paths through lattice
- We can use EM as a strategy to find a solution
- E-Step: Estimation of $p(Z|X, \theta^{old})$
- M-Step: Maximize over θ to optimize

ML solution to HMM

- Define

$$Q(\theta, \theta^{old}) = \sum_Z p(Z|X, \theta^{old}) \ln p(X, Z|\theta)$$

$$\gamma(z_n) = p(z_n|X, \theta^{old})$$

$$\gamma(z_{nk}) = E[z_{nk}] = \sum_z \gamma(z) z_{nk}$$

$$\xi(z_{n-1}, z_n) = p(z_{n-1}, z_n|X, \theta^{old})$$

$$\xi(z_{n-1,j}, z_{nk}) = \sum_z \gamma(z) z_{n-1,j} z_{nk}$$

ML solution to HMM

- The quantities can be computed

$$\pi_k = \frac{\gamma(z_{1k})}{\sum_{j=1}^K \gamma(z_{1j})}$$

$$A_{jk} = \frac{\sum_{n=2}^N \xi(z_{n-1,j}, z_{nk})}{\sum_{l=1}^K \sum_{n=2}^N \xi(z_{n-1,j}, z_{nl})}$$

- Assume $p(x|\phi_k) = N(x|\mu_k, \Sigma_k)$ so that

$$\mu_k = \frac{\sum_n \gamma(z_{nk}) x_n}{\sum_n \gamma(z_{nk})}$$

$$\Sigma_k = \frac{\sum_n \gamma(z_{nk}) (x_n - \mu_k)(x_n - \mu_k)^T}{\sum_n \gamma(z_{nk})}$$

- How do we efficiently compute $\gamma(z_{nk})$?

Outline

- 8 Markov Model
- 9 Hidden Markov Model
- 10 ML solution for the HMM
- 11 Forward-Backward**
- 12 Viterbi
- 13 Example
- 14 Summary

Forward-Backward / Baum-Welch

- How can we efficiently compute $\gamma()$ and $\xi(.,.)$?
- Remember the HMM is a tree model
- Using message passing we can compute the model efficiently (remember earlier discussion?)
- We have two parts to the message passing forward and backward for any component
- We have

$$\gamma(z_n) = p(z_n|X) = \frac{P(X|z_n)p(z_n)}{p(X)}$$

- From earlier we have

$$\gamma(z_n) = \frac{\alpha(z_n)\beta(z_n)}{p(X)}$$

Forward-Backward

- We can then compute

$$\alpha(z_n) = p(x_n|z_n) \sum_{z_{n-1}} \alpha(z_{n-1})p(z_n|z_{n-1})$$

$$\beta(z_n) = \sum_{z_{n+1}} \beta(z_{n+1})p(x_{n+1}|z_{n+1})p(z_{n+1}|z_n)$$

$$p(X) = \sum_{z_n} \alpha(z_n)\beta(z_n)$$

$$\xi(z_{n-1}, z_n) = \frac{\alpha(z_{n-1})p(x_n|z_n)p(z_n|z_{n-1})\beta(z_n)}{p(X)}$$

Sum-product algorithms for the HMM

- Given the HMM is a tree structure
- Use of sum-product rule to compute marginals
- We can derive a simple factor graph for the tree

Sum-product algorithms for the HMM

- We can then compute the factors

$$\begin{aligned}h(z_1) &= p(z_1)p(x_1|z_1) \\ f_n(z_{n-1}, z_n) &= p(z_n|z_{n-1})p(x_n|z_n)\end{aligned}$$

- The update factors $\mu_{f_n \rightarrow z_n}(z_n)$ can be used to derive message passing with $\alpha(\cdot)$ and $\beta(\cdot)$

Viterbi Algorithm

- Using the message passing framework it is possible to determine the most likely solution (ie best recognition)
- Intuitively
- Keep only track of the most likely / probably path through the graph
- At any time there are only K possible paths to maintain
- Basically a greedy evaluation of the best solution
